The principal test of the efficiency of a boiler is the quantity of water (generally expressed either in pounds or gallons), which it will evaporate with the consumption of one of coal. Of course this varies very much with the quality of the fuel, but with good pit coal (not dross), a Cornish boiler should evaporate 6 to 8 lbs. of water per lb. coal, and a multitubular boiler, such as fig. 2, about 10 or 11 lb. per lb. coal. The best rate of combustion on the grate varies with the construction of the boiler, from 10 to 18 or 20 lb. per sq. ft. of grate surface per hour.

Boilers are almost invariably made of wrought-iron plates riveted together. The parts most exposed to the action of the flame are made of the best quality of iron, and the other parts of inferior qualities, according to their position in reference to the flame. Occasionally boilers are made of steel, where lightness is the chief requisite, but makers have not yet sufficient confidence in steel plates to use them very largely. Copper is often used in the fire-boxes of locomotives, but seldom in any other description of boiler. Brass boiler tubes are often seen, and on account of its better conducting qualities, brass is to be preferred to iron, but its dearness prevents its superseding iron in the great majority of cases.

Every boiler has, to render it complete and workable, a number of *fittings* or *mountings*, of which the following are the principal: A glass gauge to show the level of the water inside the boiler, and gauge-cocks for the same purpose; a gauge to show the pressure of the steam; a cock for admitting water; a cock at the bottom for emptying or "blowing off;" a valve for the discharge of the steam; one or two safety valves, weighted so that, when the pressure of steam in the boiler reaches a certain height, they open and allow the steam to rush into the air; a door by which a man can get in to clean the boiler, etc.

In order to induce a current of air through the furnace so that a proper combustion may be maintained, stationary boilers are generally provided with a chimney of considerable height, and made of brick or sheet-iron, to which the products of combustion are conducted after they have left the boiler. In locomotive boilers, and in some other cases where a sufficiently tall chimney cannot be made use of, a very powerful current is made by the ejection of the waste steam through a blast-pipe with a contracted nozzle at the base of the chimney. To prevent loss of heat by radiation, and the consequent waste of fuel, boilers should always be covered, in all parts exposed to the atmosphere, with felt or some non-conducting composition.

For further details see also BOILING, MANOMETER, SAFETY-VALVE, STEAM, STEAM-ENGINE, STEAM-CRANE.

BOILERS (*ante*). Those most distinctively American are the sectional or water-tube boilers. The Babcock and Wilcox boiler consists of a series of tubes inclined from the front to the rear, and connected at each end by a manifold chamber. The forward ends are connected to the steam-drum, which lies lengthwise of the boiler. The tubes and manifolds are in the fire chamber, and there are two sets of diaphragm plates, by which the hot gas, after rising, is deflected, first downward and then upward, being made to cross the stack of tubes three times before making its exit into the chimney. The water fills the tubes and occupies the lower part of the steam-drum. The tubes of the Root boiler are likewise inclined from front to rear; they are joined at the ends by triangular caps and crow-feet, and the joints are perfected by rubber gaskets. The joints are outside the fire chamber, and the steam-drum lies crosswise of the boiler. The water does not fill all the tube-space within the fire-box, nor enter the steam-drum; by this means dry steam is secured, while the danger of superheating is but slight, as the space not reached by the water lies in the upper and forward part of the fire-box. The Whittingham boiler has its tubes, connections, and steam-drum, all inclosed in the fire-box; the tubes are traversed by interior tubes, or flues, through which the hot gases are conveyed, and thus a large fire surface is secured. The Harrison boiler is made of cast-iron spher-

ical shells, 8 in. external diameter, and ¾ of an in. thick; they are cast in sections, 2 or 4 spheres together, are connected by curved necks of 3¼ in. diameter, and are held together by wrought-iron bolts and caps. The joints are accurately fitted, without packing.

The water surface of a boiler is that area of metal which has water within and flame or hot gases without; at this surface the steam is generated. The area which has hot gases without and steam within is superheating surface, at which the steam by the reception of heat acquires greater expansive force. The draught-area, or calorimeter, is the cross section of the area traversed by the hot gases from the fire, and may be taken at any point between the furnace and the chimney. Ordinarily, however, it is restricted to the space around the tubes in the water-tube boilers, and to the section of the flues in flue-boilers. That boiler is most efficient which shows the greatest difference between the furnace temperature and that found at the chimney, since that difference indicates the quantity of heat which has been transferred to the water in the generation of steam. If the combustion is complete, the heat of the furnace will depend on the quantity of air furnished, that is, upon the area of the calorimeter, whence it appears that the calorimeter should be large. But if this space be an unbroken volume, much of the hot gas may pass through without impinging against the boiler surface, and delivering its heat, whence it is desirable that the space should be divided thoroughly; and it is evident that a reduced calorimeter may often give better results than a larger one, not properly arranged. A designer of boilers will find important tables on this point in *Appleton's Cyclopædia of Mechanics.*

Priming is the tendency of the water in the boiler to form spray by the bursting of the steam bubbles when they come to the surface of the water, the spray going forward with the steam into the cylinder. Here it is cooled and accumulates, especially if the exhaust port is not, either by position or capacity, adequate to its discharge. Water is practically incompressible, and if a quantity of it, greater than the volume of the clearance, is found before the piston, near the end of the stroke, it lies between the piston and the cylinder head as mischievous as a mass of metal would be in the same position. Something must yield. The crank pin may be broken, or the cylinder split, or the head burst out, and all rods and gearing will be ruined. Priming is caused by want of steam room, or of area at the surface of the water in the bodies, or by the use of dirty water. The latter cause may be cured by collecting the water in tanks, and giving it time to settle. The others may be avoided by proper construction of the boiler, by checking the steam at the throttle, or by working the engine more expansively. Any sudden removal of pressure, as the opening of the safety-valve, or of the throttle in starting, tends to produce priming, because while the water had, at the instant of the opening, a capacity for steam corresponding to the higher pressure, the diminished pressure sets free a gush of steam that is entirely disproportioned to the ordinary conditions. Some authorities advise the insertion of a perforated plate through which the steam must pass on its way to the cylinder; the water beating against this plate is arrested, and the steam passes on more freely. In some locomotives the steam is taken by a longitudinal perforated pipe, which serves the purpose of the steam dome of usual designs. Boilers in which the steam does not circulate freely because of the disposition of the tubes, are liable to the annoyance of priming.

The term *horse-power,* when applied to the boiler, has a meaning scarcely more definite than when used to indicate the capacity of the engine. In either case, the horse-power realized depends as much upon the method of using the mechanism, as upon its original construction. The best authorities agree that the horse-power of the boiler should indicate the actual evaporation of water, instead of the size of the boiler or the efficiency which may be secured through the engine. The ability to evaporate a cubic foot of water per hour, making steam at 212° F., has been suggested as a suitable unit to be called a horse-power. To ascertain the evaporative power of a boiler by experiment, it is necessary to obtain the weights of fuel and water, and to know the quality of the steam produced. A trial should last 24 hours; steam may be raised, and then fire withdrawn, and the ash-pit cleared, the steam meanwhile being maintained with wood. Coal is then added, and as soon as it is fired, the test begins. Note is taken of the height of water in the gauge, and the water is left at the same height at the end of the test. Coal is carefully weighed in regular amounts and at regular intervals to avoid errors. At the end of the trial the fire is withdrawn, and the remaining coal weighed as soon as possible; this weight, plus that of the ashes made during the experiment, taken from the weight of the coal, gives the weight of fuel consumed. To find the quality of the steam, a tank is provided, which is traversed by a pipe leading to the boiler, the whole apparatus being so arranged as to waste as little heat as possible. The tank is filled with water, and steam is admitted through the pipe in such quantity as may be condensed by the water. We have to note the pressure of the steam, the weight and temperature of the water before steam is admitted, the weight and temperature at the close of the test, the weight and temperature of the water formed from the condensed steam, and the time. Experiment must also be made to test the loss of heat by radiation and evaporation, which is done by heating a given quantity of water to a given temperature in the same tank, and noting the loss in weight and temperature during a given time. To illustrate by an example. Suppose a test made, from which these data have been secured:

Coal used, 5980 lbs.; feed water used, 42,320 lbs.; coal withdrawn at end of test, with ashes, 1830 lbs.; hence, coal burned in the test, 5980 minus 1830=4150 lbs. The apparent evaporation per pound of coal is, 42,320÷4150=10.2 lbs., if the steam were dry. To test the quality of the steam the described apparatus has been used, and these data noted: Pressure of steam at gauge, 80 lbs.; weight of steam condensed at 95°, 204 lbs.; initial temperature of water for condensing, 60°; final temperature, 92°; head of water in tank, 27 in.; time of trial, 24 hours; and by former tests it appears that 4 cu. ft. of water, weighing 62.2 lbs. per ft., pass from the tank per hour, and that the loss of heat by evaporation and radiation is 1480 thermal units per hour. The heat given to the water by the condensing steam in one hour was 4×62.2× (95 minus 60) +1480=8708 thermal units. The steam condensed per hour was 204÷24=8.5 lbs., hence each pound of steam communicated to the water 8708÷8.5=1024.5 thermal units of heat. But this condensed steam was discharged at 95°; to bring it down to the standard of 32° there must have been a farther reduction of 95 minus 30=65 thermal units, showing that the quantity of heat above freezing standard held by a pound of steam as it issued from the boiler was 1024.5+65=1089.5 thermal units. The total heat, above freezing standard, of a pound of dry steam at 80 lbs. pressure (see Rankine, *Steam Engine*, or *Appleton's Cyc. of Mechanics*), is 1177.1; it is therefore evident that the steam used in the test contained some moisture. As the temperature of the feed-water was 60°, it had already 28 thermal units of heat per pound above water at 32°, and would require 1177.1 minus 28=1149.1 thermal units to change it to dry steam; but it required 1089.5 minus 28=1061.5 thermal units to change it to steam of the quality observed, hence the actual evaporation was 1061.5÷1149.1=0.91506 of the apparent evaporation. But the apparent evaporation was 8.5 lbs. per pound of coal, and the actual was therefore 7.778 lbs. If the feed-water were at 212°, 998.5 thermal units would be required to convert a pound of water into steam. Hence, 1061.5÷998.5=10.6= nearly the evaporation per pound from and at 212°.

BOILING (of liquids)—**BOILING-POINT.** When heat is applied to a vessel containing water, the temperature gradually rises, and vapor comes silently off the surface; but at a certain degree of heat, steam (q.v.) begins to be formed in small explosive bursts at the bottom, and rising through the liquid in considerable bubbles, throws it into commotion. If, after this, the steam is allowed freely to escape, the temperature of the water rises no higher, however great the heat of the fire. The water is then said to *boil*, and the temperature at which it remains permanent is its *boiling-point*. The boiling-point of water is ordinarily 212°; but every liquid has a point of its own. Thus, sulphuric ether boils at 96°; alcohol, at 176°; oil of turpentine, at 316°; sulphuric acid, at 620°; and mercury, at 662°. The boiling-point of liquids is constant, under the same conditions, but is liable to be altered by various circumstances. Water with common salt in it, e.g., requires greater heat to make it boil than pure water. The nature of the vessel, too, exerts an influence; in a glass vessel, the boiling-point of water is a degree or two higher than in one of metal, owing to the greater attraction that there is between water and glass than between water and a metal. But what most affects the boiling-point is variation of pressure. It is only when the barometer stands at 30 in., showing an atmospheric pressure of 15 lbs. on the sq. in., that the boiling-point of water is 212°. When the barometer falls, or when part of the pressure is in any other way removed, it boils before coming to 212°, and when the pressure is increased, the boiling-point rises. —Thus, in elevated positions, where there is less air above the liquid to press on its surface, the boiling point is lower than at the level of the sea. An elevation of 510 ft. above the sea-level, makes a diminution of a degree; at higher levels, the difference of elevation corresponding to a degree of temperature in the boiling-point increases; but the rate of variation once ascertained, a method is thus furnished of measuring the heights of mountains. See HEIGHTS, MEASUREMENT OF. At the city of Mexico, 7000 ft. above the sea, water boils at 200°; at Quito, 9000 ft., at 194°; and on Donkia mountain, in the Himalaya, at the height of 18,000 ft., Dr. Hooker found it to boil at 180°. Boiling water is thus not always equally hot, and in elevated places, many substances cannot be cooked by boiling. Under the receiver of an air-pump, the same effect is still more strikingly seen; water may be made to boil at the temperature of summer, and ether when colder than ice. In complete vacuo, liquids, in general, boil at a temperature 140° lower than in the open air. The knowledge of this effect of diminished pressure is now largely turned to account in sugar-boiling, in distilling vegetable essences, and in other processes where the substances are apt to be injured by a high temperature. —By increasing the pressure, again, water may be heated to any degree without boiling. Papin's Digester (q.v.) is formed on this principle. Under a pressure of two atmospheres, the boiling-point rises to 234°; of four atmospheres, it is 294°; of ten atmospheres, 359°; of fifty atmospheres, 510°.

In a deep vessel, the water at the bottom has to sustain the pressure not only of the atmosphere, but also of the water above it. At a depth of 34 ft., the pressure of the water above is equal to an atmosphre, or 15 lbs. on the sq. in.; and thus, at the bottom of a vessel of that depth, the water must be heated to 234° before it is at its boiling-point. This principle has been successfully applied to explain the phenomena of the Geysers (q.v.).

If a small quantity of water be poured into a silver basin, heated above the boiling-

point, but below redness, it will begin to boil violently, or perhaps burst into steam at once. But if the basin is heated to redness, the water will gather itself into a globule, and roll about on the hot surface, without becoming heated to the boiling-point. For the explanation of this and other interesting phenomena connected with it, see SPHEROIDAL CONDITION OF LIQUIDS.

BOILING OF LIQUIDS (*ante*). As will be understood from the above, the terms liquid and boiling-point are entirely relative, depending upon external agents and upon each other. The statement that water is a liquid is only true under certain conditions. In the arctic regions it is a solid, and in a vessel heated to 212° under ordinary atmospheric pressure it is a vapor or gas. Nitrous oxide is a liquid under ordinary atmospheric pressure when reduced below 126° below zero, and the same is true of carbonic acid when reduced to 108.76°. Pressure, however, is capable of reducing both these gases to liquids, and modern experiments with various substances are now common in which carbonic acid is liquefied by pressure. Ammonia, commonly a gas, is a liquid when reduced to —28.66°. This substance is capable of being absorbed by a very small volume of water under heavy pressure, or, at least, of occupying a very small volume; for we cannot say that the gas is really absorbed; the water assists the pressure in holding the gas in a liquid form. Advantage is taken of this in the working of a certain class of ice-making machines, called ammonia machines (q.v.). Some of the machines, however, depend upon the vaporization of ammonia, anhydrous, or nearly so, for the absorption of sensible heat. The following is a table of the boiling-points of various substances:

SUBSTANCE.	B. point F.	Barom. meas.
Nitrous oxide	—126.22°	29.88
Carbonic acid	—108.76	30.21
Ammonia	—28.66	29.50
Sulphurous acid	13.10	29.29
Chloride of ethyl	51.80	29.84
Aldehyde	67.34	28.90
Sulphuric ether	93.56	29.21
Sulphide of carbon	118.22	29.76
Bromine	145.40	29.92
Alcohol	173.32	29.92
Water	212.00	29.92
Acetic acid	242.42	29.53
Sulphuric acid	646.00	29.92
Mercury	662.00	29.92

The investigations of prof. Kopp indicate certain remarkable laws connecting the boiling-points of classes of liquids with their chemical constitution. The following tables, calculated from the observations of prof. Kopp and others, show that in the group of alcohols, and the acids derived from them by oxidation—both of which differ in constitution by one molecule of CH_2—there is a difference of very nearly 34.2° F. between successive members of the series; and that, moreover, the difference in the boiling-points between the alcohols and their respectively derived acids is about 72°.

Alcohol.	Formula.	B. point. cal.
Methylic alcohol	CH_4O	138.2°
Ethylic alcohol	C_2H_6O	174.2
Tritylic aclcohol	C_3H_8O	206.6
Tetrylic alcohol	$C_4H_{10}O$	240.8
Amylic alcohol	$C_5H_{12}O$	275.0

Acid.	Formula.	B. point cal.
Formic acid	CH_2O_2	210.2
Acetic acid	$C_2H_4O_2$	244.4
Propionic acid	$C_3H_6O_2$	278.6
Butyric acid	$C_4H_8O_2$	312.8
Valeric acid	$C_5H_{10}O_2$	347.0

Other analogous correspondences in the boiling-points of liquids and their chemical constitution were observed; thus in the series of hydrocarbons, homologous with benzole, C_6H_6, a difference in the series of CH_2 was attended with a difference of boiling-point of about 43°.

The molecular constitution, or, more strictly speaking, the mutual relations between the molecules of liquids, particularly as regards water, whose affinities are so numerous, exerts a great influence not only upon the boiling-point, but upon the nature or manner of ebullition. Thus, if a clean glass flask is partially filled with ordinary, and, of course, more or less aërated spring water, and heated rapidly with a spirit-lamp, nearly all the air will be expelled first, but before all the air is thus expelled ebullition will commence, and at a point very slightly below 212°. After a little time, more of the air having disappeared, but not entirely, the boiling-point (at 30 in. mercurial pressure) will be 212°. By continuing the boiling, however, the mode of ebullition will be found to have

changed. If the flask is held quite still there will be intervals of time—although the application of heat is constant—when ebullition will cease; and during these intervals the temperature will rise. If the heat is taken away for a few moments so as to allow the water to come to a state of comparative rest, and then reapplied, the temperature may be raised to 220° before ebullition commences, when it will be decidedly explosive. If now the flask is corked tight, and a partial vacuum formed in the space occupied by vapor, boiling will go on until the water is quite cool, but the boiling will be of the explosive character observed in the later periods of application of heat, and when quite cool will be more irregular, partly in consequence of the reduction of atmospheric pressure, but more particularly, probably because of the increased cohesion between the contiguous molecules of water by reduction of heat.

BOILING, in cookery. One important preliminary rule in boiling rests on the fact explained in a preceding article, that water cannot be heated in an open vessel, or in one with the ordinary fitting lid of a cooking utensil, to a higher point than 212°. When a vessel, then, has once begun to boil, a stronger fire than is just sufficient to keep it boiling, will only evaporate, or waste, the water in steam, but will not cook the food any faster; on the contrary, the outside will be rendered so hard by the quick boiling, that the interior will not be reached by the heat.

By long soaking in cold or tepid water, fresh meat loses much of its albumen and nutritive juice. When a piece of meat is to be boiled, it is necessary, for the preservation of these juices, and its consequent tenderness and nutritious quality, that the outside should be sealed up, by immersing it in boiling water, and keeping up the temperature for a minute; this closes up the pores, and coagulates the albumen of the exterior. The boiling water should then be taken off, and as much cold put in as will reduce it to a tepid state; it should then be gradually warmed until it reaches a degree *slightly* under the boiling-point, called simmering; at this point it must be kept without suffering any interruption of the heat, till the time elapses that is allowed for cooking the food. "The cooking goes on through the agency of the natural moisture of the flesh. Converted into vapor by the heat, a kind of steaming takes place within the piece of meat; it is, when skillfully done, cooked by its own steam."

To prepare meat for B., it should be trimmed, washed, and dried before it is placed in the water. As it simmers, the water should be kept well skimmed with a skimming-spoon, as frequently as any scum is thrown up, but with due remembrance of the fact, that raising the lid of the vessel lowers the temperature of the water; and the preservation of an equal degree of heat throughout the operation is of the greatest importance.

For fresh meat, 20 minutes is the allowance for each pound. The weather must also be considered: in frosty weather, or with very thick joints, extra 20 minutes should be given. Mutton loses in boiling, in 1 lb., 3½ oz.; beef, in 1 lb., 4 oz. Meat that has been salted and dried has its outer coat already sealed up; it requires, therefore, to be thoroughly washed, soaked for two hours in cold water, dried, and put to boil in cold water, gradually brought to the boiling-point, and kept simmering for a time, proportioned to the size of the piece. Hams and tongues to be eaten cold, should be allowed to cool in the water in which they have been boiled. The following is a time-table for the cooking of these meats, reckoning from the time the water boils: A ham of 16 lbs. takes 4 hours; a tongue of 16 lbs., 2 to 4 hours; a pig's face of 16 lbs., 2 hours; a piece of bacon of 4 lbs., 2 hours.

Poultry and white meats, as veal or rabbit, should be put at once into tepid water gradually brought to the boiling-point, drawn back immediately, and simmered, carefully skimming the water as scum rises. A chicken, or small fowl, or rabbit, will take 35 minutes; a fowl, or old rabbit, an hour, or an hour and a half, according to size. Some cooks add milk to the water, but this is apt to cause the scum to stick to the meat in streaks; some also use a cloth to inclose the meat, but this frequently imparts to it a disagreeable taste. Having trimmed, washed, and dried the meat, all that is necessary to keep it white, is to use a perfectly clean utensil, to be attentive to the skimming, and careful that no soet falls from the lid into the pot when doing this. Meat should only just be covered with water; if it wastes, a cupful of water at the same temperature should be added. The liquor in which fresh meat has been boiled, is an excellent foundation for soups and gravies.

Fish should be well cleaned and scraped; liver and roe should be carefully preserved, and boiled with the fish, in a fine net: they are used to garnish the fish. The sound of cod should be carefully cleaned, and left in the fish. Fish should be placed in cold water, in which a tablespoon full of salt and one of vinegar is mixed; should be gradually brought to the boiling-point, and simmered carefully, lest the outer part should crack before the thick part is done. If on drawing up the fish-plate, a thin knife will easily divide the flesh from the bone in the thick parts, and if the eyes contract, and become like balls, the fish is sufficiently cooked. Drain by laying the plate across the kettle covered with the lid, and dish perfectly dry on the strainer, which should be covered with a napkin.

Vegetables require generally to be well washed, and placed in B. water, in which is mixed a large spoonful of salt. When they sink, they are done. Green vegetables should be well picked, soaked in salt and water, drained and boiled in plenty of water, in a vessel without a lid. Cabbage requires two waters; spinach, very little, as it is full

of moisture. Peas and beans should not soak, but be merely rinsed in a colander. Winter potatoes should soak for an hour or more; whether they should be placed in cold or B. water, depends on the sort. A piece of soda the size of a small marble assists the B. of peas and cabbage, if the water is very hard.

For B. meat, the best vessel is one made of iron, tinned inside or not, but one kept perfectly dry, and free from grease or rust. Tinned vessels are proper for B. fish and vegetables; they require to be kept very dry, the moisture entering between the metals rusts the iron, and makes holes that cannot be mended. A tinned vessel in daily use should be polished once a week with fine whiting and oil; too frequent polishing wears off the tin. The advantage of a tin over an iron utensil is, that it gains heat sooner.

BOIS D'ARC. See OSAGE ORANGE, *ante.*

BOIS BLANC, an island of the United States of America, situated in lake Huron, between Michillimackinac and Michigan. It measures 10 m. by 3, and has a light-house at its east end.

BOIS-DE-BOULOGNE. See BOULOGNE.

BOIS-LE-DUC (Dutch, *'s Hertogenbosch*, "Duke's Forrest"), the capital of the Netherlands province of n. Brabant, is situated at the junction of the Dommel and the Aa. The fortifications are greatly strengthened by the natural situation, as the surrounding country can be flooded, leaving only two roads passable. It is a clean, well-built town, about 5 m. in circumference, intersected by canals, and has a citadel called Papenbril. B. has a very fine cathedral, and academy of arts, a grammar-school, several hospitals, etc. Iron-founding, making ultramarine, book-printing, refining salt, beer-brewing, distilling spirits, manufacturing linen-thread, ribbons, cutlery, etc., are the principal industries. Pop. (Jan. 1, 1875), 24,190. B. is a place of considerable antiquity, having been founded in 1184 by Godfrey III., duke of Brabant. The surrounding forest was cut down by his son and successor Henry, who strengthened the town with walls. In the 16th c., B. separated itself from the states, and was ineffectually besieged, in 1601 and 1603, by prince Maurice of Nassau, but had to surrender to a Dutch force in 1629. In 1794, B. was taken by the French; and in 1814, retaken by the Prussians.

BOISÉ, a co. in s.w. Idaho, on Little Salmon river; about 2500 sq.m.; pop. '70, 3834—1754 Chinese. It is a mining region. Co. seat, Idaho City.

BOISÉ CITY, in Idaho, capital and chief city of the territory, on the Boisé river, 285 m. n.w. of Salt Lake City, and 520 m. n.e. of San Francisco. It has a government assay office, and a penitentiary. It is on the site of an old trading-post of the Hudson Bay company.

BOISSERÉE, SULPIZ, a celebrated archæologist, was b. at Cologne in 1783. A visit which he and his brother Melchior (born 1786), along with their friend Joh. Bapt. Bertram, paid to Paris in 1803, inspired the trio with the idea of collecting and preserving the scattered specimens of early German art. The realization of this idea became the single object of their lives. After many years of patient and unwearied research, they gathered together 200 pictures, which received the name of "the Boisserean collection." The king of Würtemberg having presented the brothers with a spacious edifice in Stuttgart, the pictures were transferred thither, and skillfully arranged, according to their age and importance. This brought to light a very important historical fact, previously unknown—viz., that in the 14th c. Germany possessed a school of art based on Byzantine traditions. Great light was also thrown upon many of the Flemish masters, and especially on the influence exerted by Jan Van Eyck. The collection was divided into three sections corresponding to three historical periods—the first comprising the works of the Cologne school in the 14th c.; the second, those of Van Eyck and his disciples in the 15th; and the third, those of the German painters at the close of the 15th and beginning of the 16th centuries. In 1827, the collection was sold to the king of Bavaria; and in 1836 was transferred to the picture-gallery (*pinakothek*) in Munich, whither the brothers followed it. Sulpiz died in 1841, and Melchior in 1851. The former has left several interesting and valuable works; such as *Monuments of Architecture on the Lower Rhine, from the 7th to the 13th c.* (Munich, 1830–33); *Concerning the Temple of the Holy Grail*, 1834; *Collection of Old Low and High German Paintings, with Notices of the Early Painters, by Sulpiz and Melchior B. and Joh. Bapt. Bertram, lithographed by J. V. Strixner* (1822–39); and a very magnificent work, entitled *Views, Plans, Sections, and Details of the Cathedral of Cologne, with Restorations after the Original Plan, accompanied by Researches on the Architecture of Ancient Cathedrals*, etc. (1823–32).

BOISSONADE, JOHN FRANCIS, a distinguished classical scholar, b. at Paris, Aug. 12, 1774, of a noble Gascon family. He was originally intended for the administrative career, but after experiencing some of its more violent vicissitudes, he renounced it for philology, in which he had always found his favorite recreation. He soon made himself known to the critical world by his acute and learned contributions to the literary journals, was appointed professor of Greek in the academy of Paris in 1809, and entered on the active duties of the chair in 1812. In 1813, he was admitted into the academy of inscriptions; and in 1828, he succeeded Gail as professor of Greek literature in the college of France. Beyond this high position he never aspired, but pursued his investigations with an energy which no mere social or public ambition could distract. His more

important works are these: *Philostrati Heroica* (Paris, 1806); *Marini Vita Procli* (Leip. 1814); *Tiberius Rhetor de Figuris* (Lond. 1815); *Sylloge Poetarum Græcorum* (Paris, 1823–26); *Babrii Fabulæ* (Paris, 1844), etc. He contributed in his earlier years numerous papers on philological subjects to Parisian, English, and German journals, and gave the cause of classical study in France a powerful and still perceptible impulse by his eloquent and attractive lectures from his chair. In spite of his many and laborious philological works, he also signalized himself as a French lexicographer and belle-lettrist, and was one of the most copious and valued contributors to the *Biographie Universelle* He died in 1859, leaving behind him a reputation for learning almost German in its profundity, and more than English in its elegance.

BOISSY D'ANGLAS, FRANÇOIS ANTOINE, Count, an eminent French statesman, was born at St. Jean Chambre, in the department of Ardèche, Dec. 8, 1756. After filling for some time the office of major-domo to the count of Provence (Louis XVIII.), he was about to devote himself to the peaceful pursuits of science, when he was elected a deputy to the states-general. While a member of the constituent national assembly, he was accused of having a design to change the French monarchy into a Protestant republic. During the reign of terror, fear of "the mountain" kept him quiet; but, yielding to the solicitations of Tallien and Barère, he joined the conspiracy against Robespierre. Two months after the execution of the tyrant, he was elected secretary of the convention; and shortly after, a member of the committee of public safety, in which capacity he displayed remarkable talent and discretion. As director of the supply of provisions for Paris, he was exposed to popular hatred and great peril during the riotous and sanguinary proceedings of the 12th Germinal and 1st Prairial in the year 3 of the republic; but firmness and presence of mind preserved him. He was afterwards president of the council of five hundred; was called into the senate by Napoleon; and made a peer by Louis XVIII. Through all the changes of the times, he maintained the principles with which he had commenced his career. He died in Paris, Oct. 20, 1826. His chief writings are *Recherches sur la Vie, les Ecrits, et les Opinions de Malesherbes*, 1819, and *Etudes Littéraires et Poétiques d'un Vieillard*, 1825; but, in addition to these, he published numerous essays, pamphlets, and letters.

BOIVIN, MARIE ANNE VICTOIRE GILLAIN, 1773–1841; educated in a nunnery; studied anatomy and midwifery; married and was soon left a widow, when she took the place of midwife in the maternité hospital, and in 1801 became superintendent. She caused the establishment by Chaptal of a special school of accouchement. Her *Memorial de l'Art des Accouchements* is a well-known work.

BOJADOR', CAPE, a headland on the w. coast of Africa, in lat. 26° 7′ n., long. 14° 29′ w., forming the western extremity of the Jebel Khal (or Black mountains), a rocky ridge running eastward into the Sahara. In consequence of its extreme flatness, and the shoreward tendency of the currents, the coast, extending northwards to cape Nun, is one of the most dangerous that mariners have to encounter, and is frequently the scene of shipping casualties. The Portuguese doubled this cape in 1433, and from them it received its name B.C., signifying "a round cape."

BOJA'NO, a t. in the province of Campobasso, Italy, 13 m. s.w. of the t. of Campobasso. It is situated on the Biferno, in a deep gorge at the foot of the mountain-range of Matese; has a cathedral and some ancient remains. It has suffered greatly from earthquakes, and especially from one which occurred in 1805. Pop. 3500. B. is said to occupy the site of the famous Samnite city of *Bovianum*, but T. Mommsen thinks that Bovianum lay 20 m. to the north. Unsuccessfully besieged by the Romans in 314 B.C., it was taken by them in 311, and yielded immense spoils. Passing out of their hands, it was retaken by them in 305 B.C.; and once more reverting to its original owners, was a third time captured by the Romans, in 298 B.C. During the second Punic war, it formed the headquarters of the Roman army on more than one occasion; and in the great social war, the confederates, on the fall of Corfinium, made it their capital and the seat of their general council. Surprised by Sulla, it was retaken by the Marsic gen., Pompædius Silo. Cæsar established a military colony here; and afterwards, under the Roman empire, the town seems to have recovered considerably from the ruin which overtook it on the general devastation of Samnium.

BOJAR (pronounced *Boyar*), a word originally of the same meaning as Czech, Lech, and Bolgarin, i.e., free proprietor of the soil. The Bojars, in old Russia, were the order next to the knjazes or knjeses (ruling princes). They formed the immediate "following" of these princes, and bore somewhat of the same relation to them as the lesser English and Scottish knights of the feudal ages did to the great barons Percy, Douglas, etc. They had their own partisans, who served them as a kind of body-guard; they gave their services to a prince of their own choice, whom, however, they left again at their pleasure, and, in consequence of this, the knjazes could only secure their allegiance by the bestowment of privileges which were often abused. They held exclusively the highest military and civil offices, and were so universally looked up to by the mass of the people, that the most powerful rulers, even Ivan the cruel, considered it prudent to use this form of expression in their ukases: "The emperor has ordered it; the Bojars have approved it." Rank among the Bojars was always proportioned to length of state-service, and was

observed with the utmost rigor, so that the B. who had obtained an office, as it were, yesterday, looked down with proud contempt on him who only entered on his to-day. This singular mode of securing gradation of rank was called *miestniczestwo*. It was a most peculiar phenomenon of Slavic life, equally unlike feudalism and modern aristocracy, and must be regarded as a strictly national development. In their housekeeping the Bojars were excessively fond of splendor, and their contempt for the serfs or "lower orders" was immeasurable. In the lapse of time, many Chinese customs—as might be expected from their theory of rank—crept into their public life. Their power, and the respect which was paid them, acted as a wholesome check upon the otherwise unbridled authority of the princes; in consequence of which, the latter became their bitter enemies, and often sought to destroy their power. This was finally done by Peter the great, who abolished the order of Bojars by giving them a place among the Russian nobility, but, at the same time, stripping them of their peculiar privileges. The last B., Knjaz Ivan Jurjewicz Trubeckoj, died 16th Jan., 1750.

In Moldavia and Wallachia, Bojars still exist. They have a seat and vote in the council of the prince, and, as ancient history shows, exercise at times a most extensive influence.

BOKER, GEORGE HENRY, b. Philadelphia, 1824; graduated at Princeton; studied but did not follow the law. In 1847, he published a volume, *The Lesson of Life and other Poems*, and soon afterwards *Calaynos, a Tragedy*, which was acted in London. This was followed by *Anne Boleyn*, *Leonor de Guzman*, and *Francesca da Rimini*. A few years later he published his *Plays and Poems*, and in 1864, *Poems of the War*. In 1871, he was appointed United States minister resident at Constantinople.

BOKHA'RA (i.e., Eastland), or USBEKISTAN, is the name given to the countries of Independent Tartary, under the rule of the khan of Bokhara. The most important part of it formed the ancient Sogdiana. The extent of the khanate of B. has been constantly undergoing changes. Until recently, it included the whole basin of the Zar-afshan; but the Russians have now annexed Samarcand, and the lower basin of the river forms the essential part of the territory. The population of the present khanate has been estimated at from 1,000,000 to 2,500,000.

Only in the neighborhood of the rivers is cultivation possible. The rest of the soil of B. is composed of a stiff arid clay, interspersed with low sand-hills. B. belongs exclusively to the basin of the sea of Aral. It has only three rivers of any importance—the Amu or Jihun (anciently the *Oxus*), the Zar-afshan, and the Kurshi. Entering B. at Kushtuppa, the Amu flows through the country in a W.N.W. direction to the sea of Aral. Its banks in some parts are very fertile, especially in the neighborhood of Balkh. The Zar-afshan, which rises in the spurs of the Thianshan mountains, after a course of about 200 m., issues out into the plain near Samarcand, and thence fertilizes the district (Meeankal) to the city of Bokhara. Before reaching the city, it sends out a northern branch, which, after a fertilizing course of several miles, is absorbed in the sand. The southern branch passes B. to the N., and terminates in the lake of Kara-kool, a sheet of salt water about 25 m. in circumference, which is connected with the Amu by irrigating canals. The valley of the Zar-afshan is the richest as well as the most populous in Bokhara. The Kurshi has a course of about 60 m. before it is lost in the desert.

The climate of B. is moderate and healthy. Its geographical position secures B. the transit-trade between Russia and the S. of Asia. The rains usually commence and end with February. Violent sand-storms are frequent, and occasion ophthalmia among the inhabitants, who are also subject to the attacks of the guinea-worm, which penetrates into the flesh, causing great pain and annoyance.

Minerals are scarce. The sands of the Oxus yield gold. Salt deposits are numerous. Alum and sulphur are found in the vicinity of Samarcand, and sal-ammoniac in the mountainous districts. The other products include rice and cotton, wheat, barley, beet-root, vegetables, hemp—which is only used in the preparation of an intoxicating liquor called *bhang*—silk, fruits in immense abundance, and tobacco. The camel's thorn, a plant that grows luxuriantly in Samarcand and Kurshi, exudes a saccharine gum or manna, extensively used as sugar.

Sheep and goats form a great source of wealth. Camels are numerous and valuable; the horses are celebrated for their strength and endurance; and the breed of asses is excellent.

The industry includes the manufacture of silk-stuffs, cotton-thread, shagreen, jewelery, cutlery, and fire-arms. The population, like that of the other khanates of Turkestan, consists chiefly of Tajiks of Persian, and of Usbeks and Turkomans of Turkish origin.

B. was conquered by the Arabs in the beginning of the 8th c., who were dispossessed of it in 1232 by Genghis Khan. It fell into the hands of Timur in 1303, and was taken by the Usbeks in 1505, and it has since remained under the rule of the same Turkish race. During the 18th c., the khans were characterized by the worst abominations of eastern vice and fanaticism, and B. lost its pre-eminence among the khanates of Turkestan. The canals, which alone gave fertility to the country, were neglected; and large areas were again overspread by the desert; the population diminished; B. became a center of corruption and anarchy. About 30 years ago, it was ruled by the khan Nasrullah, a barbarous and incapable tyrant. It was he who caused, in 1843, the murder

of col. Stoddart and capt. Conolly, who went on a mission to B. Dr. Wolff, who visited the country in 1844, with a view to ascertain their fate, narrowly escaped with his life, after a detention of some months. After the capture of Tashkend by the Russians in 1865 (see TURKESTAN), a religious war was preached against the Russians, and the khan, Muzaffer-Eddin, was compelled to oppose them. He was defeated at the battle of Idjar on 20th May, 1866, and in May, 1868, Samarcand (q.v.), one of the most important cities of B., was taken. The command of the upper course of the Zar-afshan, which fertilizes the central part of B., placed the khan entirely under the power of Russia. On the 30th July, 1868, a peace was concluded, by which Samarcand was ceded to the czar, and stipulations were entered into, favorable to Russian trade. The treaty caused great dissatisfaction to the fanatic Mussulmans of B. They rose in rebellion, placing at their head khan Abdul Malik Mirza, the son and heir of the khan. The Russians, on the intercession of the khan, aided him; and in Oct. the rebels were defeated near Karchi. The rebel prince sought refuge in Afghanistan. Shere Ali, the ameer, gave him a warm welcome, and would have invaded B. had he not been restrained by lord Mayo, the Indian viceroy, who told him that England could not encourage him in any attack on his neighbors. While Shere Ali was meditating an invasion of B., Abdulrahman, a nephew of Shere Ali, who had married a daughter of the khan of B., endeavored to obtain Russian aid in invading Afghan Turkestan with a Bokharian army. But, in this case, Russia opposed the enterprise (see AFGHANISTAN). During the invasion of Khiva in 1873, the khan of B. efficiently assisted the Russians, and was rewarded by a large addition to his territory from the Khivan possessions on the right bank of the Oxus, under the treaty entered into between Russia and Khiva in July, 1873.—See *History of Bokhara from the Earliest Period to the Present Time*, by Arminius Vambery (1873).

BOKHA'RA (honored with the title of the "Treasury of Sciences"), a famous city of Central Asia, capital of the above khanate, is situated on a plain in lat. 39° 48′ n., long. 64° 26′ e., in the midst of trees and gardens. It is between 8 and 9 m. in circumference, and surrounded by embattled mud-walls, about 24 ft. high, and pierced by 11 gates. The houses, which are small, ill-lighted, and, with the exception of those belonging to the wealthy, uncomfortable inside, are built of sun-burnt bricks on a wooden frame-work; and the roofs of all are flat. The streets are ill-paved and very narrow, the widest barely sufficing for the passage of a loaded camel, while others are not more than 3 or 4 ft. across. The palace of the khan occupies an eminence of between 200 and 300 ft. in height in the center of the city. It is surrounded by a brick wall of 60 or 70 ft. high. The area includes, besides the palace, the harem, which is quite embosomed in trees; various public offices, the residences of the vizier and other important state functionaries, the barracks, royal stables, etc., and three mosques. The mosques, which are said (fabulously) to be 360 in number, necessarily form one of the greatest features of Bokhara. The most imposing one occupies a square of 300 ft., and has a cupola 100 ft. high, ornamented with blue tiles. Attached to it is a tower of about twice the height, built by Timur, from which criminals are hurled. B. is celebrated as a center of learning, and has, in addition to a vast number of schools, about 80 colleges, which are attended, it is stated, by about 5000 students. As a commercial town, B. is the most important in Central Asia. A canal intersects the city, but during the summer months it is often dried up, and water becomes very scarce. Pop. estimated at 70,000. See TURKESTAN.

BOKHARA CLOVER. See MELILOT.

BOL, FERDINAND, 1611–81; a Dutch painter, pupil and imitator of Rembrandt. Many of his paintings are to be seen in Amsterdam.

BO'LA BO'LA, or BONA BONA, or BORA BORA—the liquids *l*, *n*, *r*, being interchangeable, or rather, perhaps, undistinguishable in the languages of Polynesia—one of the Society islands, about 200 m. to the n.w. of Tahiti. It is in lat. 16° 32′ s., and long. 151° 52′ w., presenting a valuable landmark in a double-peaked mountain of considerable height. It contains about 1800 inhabitants; and it is about 24 m. round, beset by coral-reefs, some of them rising into islets.

BOLAN' PASS, a hollow route ascending in a generally w. direction from Sinde, on the Indus, through Beloochistan to Candahar and Ghuzni. Its entrance and its outlet are respectively 800 and 5793 ft. above the level of the sea. The total ascent, therefore, is about 5000 ft., which, on a length of barely 55 m., gives an average of fully 90 ft. to the mile. Along the bottom of the pass descends a torrent, which the road generally follows. The route, without being impracticable, is highly defensible in a military point of view. It is bounded throughout by eminences of at least 500 ft. in height; and yet, in 1839, a division of the British army, which invaded Afghanistan, accomplished, with a heavy train of artillery, the whole distance in six days. From the outlet of the B. P. there is no fall towards the w., the spacious plateau of the Dasht-i-Bedowlut retaining the level of the upper extremity.

BOLAS, a missile used by South American Indians in capturing wild cattle. It consists of two leather balls, covered and united by a narrow but stout thong. The cattle-hunter holding one ball swings the other around his head until proper momentum is gained, and then launches the B. at the legs of the animal, which it instantly ties

together, rendering him helpless. The B. has been effectively used in war. If the balls be of iron or lead, it may be thrown a great distance.

BOLBEC, a well-built t. of France, in the department of Seine-Inférieure, about 18 m. n.e. of Havre, on the railway between that place and Paris. B. is situated on a stream of the same name, which supplies the water-power for several mills, where woolen, linen, cotton, and chemicals are manufactured. Pop. '76, 9778.

BOLE is the term applied to an earthy mineral resembling clay in structure, and consisting essentially of silica, alumina, and red oxide of iron. It occurs in nests and veins in basalt and other trap-rocks, in Scotland, Ireland, France, Armenia, Italy, Saxony, and South America. It feels more or less greasy when placed between the fingers; is of different colors—yellow, red, brown, and black; has a dull resinous luster, but a shining streak; is readily friable; and often adheres to the tongue when brought in contact therewith. *Armenian B.* has a red tint, is often used for coloring false anchovies, and is also employed in coloring tooth-powders. *Lemnian earth* is the B. from the island of Lemnos, is red in color, and was at one time prescribed by medical men as a tonic and astringent medicine; and acted beneficially, no doubt, from the large percentage of oxide of iron present. The boles which are employed in veterinary practice in Europe are generally made from Armenian bole. The savage tribes in South America eat B. to allay the pangs of hunger; and the inhabitants of Java use cakes made of it, under the name of *tanaampo*, when they wish to become slender. When B. is calcined, it becomes hard; and when afterwards levigated, a coarse red kind is used as a pigment in Germany under the names of *English red* and *Berlin red*. *French B.* is pale-red; *Bohemian B.*, reddish-yellow; *Silesian B.*, pale-yellow; and *Blois B.* is yellow.

BOLE'RO, a Spanish national dance, mostly in the time of a minuet, with a sharp, marked, and peculiar rhythm. It is accompanied with the castanets and the cithern, and frequently with the voice; and the dancer in the movements seeks to represent the different degrees of feeling from coyness to the highest ecstasies of love.

BOLE'TUS, a genus of *fungi* (q.v.), of the division *hymenomycetes*, subdivision *polyporei*. The older botanists included in it the numerous species now forming the genus *polyporus* (see AMADOU, DRY ROT, and POLYPORUS) and other genera; but even as now restricted, it is a very extensive genus. Most of the species resemble the common mushroon and other species of *agaricus* in form; but instead of gills, the under-side of the cap (*pileus*) is occupied by a layer quite distinct from it in substance, and pierced by pores so as to be composed of a multitude of small tubes united together, on the inside of which the *spore-cases* or seed-vessels are produced. Some of the species are edible. *B. edulis* is much used in France, also in Germany, Hungary, Russia, etc. It is the *ceps ordinaire* of the French markets. It grows on the ground in thin woods of oak, chestnut, or beech, and sometimes in mountainous districts, in places covered with moss, heath, or grass. In moist warm summers, it sometimes appears in prodigious quantities. It has also been partially cultivated, by inclosing a portion of a wood, and watering the ground with water in which the plant has been steeped, thus, in fact, sowing its minute seeds or spores. In Britain, it is comparatively rare. The cap is smooth, 6 or 7 in. across, with a thick margin, varying in color from light-brown to brownish-black; the tubes at first white, then yellow, and finally yellowish-green; the stem thick and solid, beautifully reticulated. The tubes are removed along with the skin and stem, and only the flesh of the cap is eaten, which is firm, white, delicate, of agreeable smell, and is prepared like the common mushroom, dried to flavor sauces, ragouts, etc., or eaten raw with salt and pepper. It is wholesome and nutritious, and this is certainly to be reckoned one of the very best of the edible fungi, and deserves much more attention than it has yet received in Britain.—*B. scaber* is another edible British species, but much inferior.—*B. æneus* is the *ceps noir* of the French markets, and *B. aurantiacus* is the *gyrole rouge* or *roussile*. They are used like *B. edulis*.

BOLEYN, ANNE, wife of Henry VIII., king of England, was b. about the year 1507. Her father was sir Thomas B., afterwards viscount Rochford and earl of Wiltshire; her mother, the daughter of the duke of Norfolk. In her seventh or eighth year, Anne B. went to France with Mary, sister of Henry VIII., and remained in France after Mary—who had married Louis XII.—returned to England as a widow, under the protection of queen Claude, wife of Francis I., who was much pleased with her beauty and liveliness. It is not known exactly when she returned to England, but it is certain that she was one of queen Catharine's maids of honor in 1527, in which year the king seems to have conceived and expressed a passion for her, to which she apparently refused to listen on other condition than that she should become his wife. Henry's religious scruples regarding the lawfulness of his marriage with Catharine, whether he had entertained them before (as is alleged) or not, certainly became much more impatient than they had hitherto been—much too urgent, indeed, for the slow decision of the court of Rome. He, accordingly, without waiting for the award of his holiness, entered privately into matrimonial relationship with Anne B., in Jan., 1533, or, as some authorities have it, in the Nov. previous. In Sept., 1533, the princess—afterwards queen—Elizabeth was born. The new queen, naturally light and gay of heart, and educated at the French court, where these qualities were likely to be developed to the utmost, conducted herself

towards the courtiers with an easy familiarity not customary in England for one in her position. Concerning the first two years of her married life, we have little information, only it is known that she was favorable to the reformation, and promoted a translation of the Bible. In 1535, the affections of the king appear to have become alienated from her. According to some historians, the amorous monarch had already fixed upon a successor to Anne B.; others make out that his passion had nothing to do with her death, and assert that Henry contracted his unseemly hasty marriage with Jane Seymour solely at the request of the peers and privy council. If this latter statement could be thoroughly relied on, it would no doubt tell strongly against Anne B., as there would then be no apparent motive for Henry seeking her condemnation if she were innocent. Between conflicting historians, one may well hesitate to decide on this point. In Feb., 1536, the queen gave birth to a son, still-born. The king now became more and more estranged from her; and her freedom of manners had given but too good grounds for her enemies to speak evil of her. On the 1st of May, the annual tournament was held at Greenwich, in presence of the king and queen. The tilting had commenced, the challengers being viscount Rochford, brother to the queen, and sir Henry Norris, one of the gentlemen of the king's privy chamber. Suddenly the king rose—his outward bearing manifesting inward disturbance—left the tourney, and with a small party rode up to London, leaving the queen at Greenwich. The popular account is, that the king's sudden departure was occasioned by the discovery of a handkerchief belonging to the queen in the possession of Norris; but the necessity for any such romantic and sudden cause of jealousy is obviated by the fact, that, in the previous week, a commission, composed of members of the privy council, had been secretly engaged in examining into charges of adultery against Anne; and two of her alleged accomplices in the crime, sir William Brereton, a gentleman of the king's household, and Mark Smeton, a musician at court, had been already arrested. The queen remained at Greenwich that night. On the following morning, she was examined before the privy council, under the presidency of the duke of Norfolk, her uncle, but a bigoted Roman Catholic, and protested her innocence. In the afternoon, however, she was sent up the river to the Tower. Sir Henry Norris, and sir Francis Weston, another courtier, along with Smeton, were also examined, and all at first declared their innocence of the charge imputed to them; but afterwards the musician confessed to the crime. Norris, too, it is said, made a like confession; but he indignantly repudiated it the next day, on the ground that he had been entrapped into it unwittingly. In the Tower, the queen's every action and word were watched and reported on; but anything she said while a prisoner seems quite as compatible with innocence as guilt, although her words unquestionably prove her to have exhibited a dangerous levity towards the courtiers; for which, however, her French education may be held to account. Her letter to Henry, written on the 6th of May, speaks decidedly in her favor. On the 10th of May, the grand jury of Middlesex found a "true bill" on the indictment, which charged the queen with committing adultery with no less than five persons, including her own brother, lord Rochford, and of conspiring with them, jointly and severally, against the life of the king, the adultery being alleged to extend over a period of nearly three years. On the 11th, the grand jury of Kent found a true bill likewise. On the 12th, the four commoners, Brereton, Weston, Norris, and Smeton, were found guilty, the last confessing to the charge of adultery only, the other three pleading not guilty to both charges. On the 15th, the queen and her brother were tried before 27 peers, the president being the duke of Norfolk. They affirmed their innocence; but they were found guilty, and condemned, the queen to be burned or beheaded on the Tower green. On the 17th, Smeton was hanged, and the other four beheaded; general protestations of unworthiness by them at the hour of death being regarded by some historians as evidence of particular guilt. On the 19th, the queen was beheaded—having previously confessed to Cranmer some engagement that rendered her marriage with the king illegal—with her last words praying a blessing on Henry, who, she said, had ever been to her a good and gentle lord, but making no confession of guilt.

It is difficult, if not impossible, to form anything like a just and satisfactory estimate of the character of Anne B.; historians, for the most part, having made her but a lay-figure upon which to hang the drapery of religious partisanship, or to display the colors of individual sympathy. That, with the courtiers, she maintained not that dignity which becomes a queen, but was unguarded in manner, and thoughtlessly free of speech, there can be no question; there is much room to doubt that she was guilty of the heinous offenses laid to her charge. A woman who resisted for years the criminal solicitations of the king, was not likely to seduce systematically grooms of the chamber; nor is it at all probable that one so diabolically bad as she must have been, if the charges alleged against her were true, could be so utterly devoid of that cunning necessary to the practice of successful wickedness. Again, it seems scarcely possible that such an extensive system of conspiracy and crime could have been carried on for nearly three years without being noticed by the lynx eyes, and blown upon by the calumnious tongues, of her numerous and powerful enemies, especially if there were truth in the statement in the indictment, that her accomplices were "very jealous of each other." On the other hand, it appears monstrous to suppose that 70 noblemen and commoners of England, before whom the case in its various stages came, against most of whom even slander had not a word to say, should have deliberately condemned a queen and five of her asso-

ciates, and their own, without conclusive evidence. In the absence of the evidence which they had before them, however, it appears to us that the proper verdict for history to pronounce is the intermediate one of *not proven*.

BOLGRAD', a t. in Moldavia, 28 m. n.n.w. of Ismail; pop. '66, 9114. B. was formerly in Bessarabia, but was ceded to Moldavia by Russia in the Paris treaty.

BO'LI, or BOLY, a t. of Asia Minor, in the pashalic of Anatolia, on the left bank of the river Boli, and on or near the site of the Roman Hadrianopolis, 136 m. e. from Constantinople. The town occupies an eminence, at the extremity of a fertile plain. It has several mosques. There are mineral springs near the town, and baths much frequented by the Turks. B. is on the caravan route from Constantinople to Erzeroum. Pop. 10,000.

BOLINGBROKE, HENRY ST. JOHN, Viscount, b. at Battersea, Oct. 1, 1678, was educated at Eton and Oxford, after which he traveled for about two years on the continent, and in 1700, shortly after his return, married the daughter of Sir Henry Winchcomb, from whom, however, he soon separated. Up to this period, he was chiefly notable for his extreme dissipation; but having entered parliament in 1701, he devoted himself to politics, and joining the tory party, soon made himself prominent as an orator. In 1704, he was made secretary at war. This office he retained till 1708, when the whigs came into power, after which he retired from politics, and gave himself up to study, but still retained great influence as the queen's favorite counselor. On the fall of the whig party in 1710, he was made secretary of state for foreign affairs. In 1712, he was called to the house of lords by the title of viscount Bolingbroke, and in 1713, against the wish of nearly the entire nation, concluded the peace of Utrecht. Having previously quarreled with his old friend Harley—now earl of Oxford, and his most powerful rival—he contrived his dismissal in July, 1714, and immediately proceeded to form a strong Jacobite ministry, in accordance with the well-known predilections of his royal mistress, whose death, however, a few days after, disconcerted his dangerous and unprincipled schemes. The accession of George I. proved a death-blow to his prospects. On the 28th of Aug., he was deposed from office; in Mar., 1715, he fled to France; and in Aug. of the same year was attainted. For some time he held the office of secretary of state to the pretender; but his restless and ambitious spirit yearned for the "large excitement" of English politics. His efforts to obtain a pardon not proving in the mean time successful, he retired to a small estate which he had purchased near Orleans. In 1718, his first wife died, and in 1720 he married the rich widow of the marquis de Vilette. A judicious use of this lady's wealth enabled him to return to England in Sept., 1724. His property was restored to him, but he was never permitted to take his seat in parliament. He therefore betook himself to his villa at Dawley, near Uxbridge, where he occasionally enjoyed the society of Swift, Pope, and others of his old friends with whom he had corresponded in his exile, and where he diversified his moral and metaphysical studies by his attacks on the ministry in his periodical, the *Craftsman*, in which the letters forming his *Dissertation on Parties* first appeared. In 1735, finding his political hopes clouded forever, he went back to France, in deep chagrin, and continued there till 1742. During this second residence abroad, he wrote his *Letters on the Study of History*, in which he violently attacked the Christian religion. He died, after a long illness, 1751. His talents were brilliant and versatile; his style of writing was polished and eloquent; but the fatal lack of sincerity and honest purpose which characterized him, and the low and unscrupulous ambition which made him scramble for power with a selfish indifference to national security, hindered him from looking wisely and deeply into any question. His philosophical theories are not profound, nor his conclusions solid, while his criticism of passing history is worthless in the extreme. He was one of those clever, unscrupulous men, unhappily too common, who forget that God has something to do with the government of this world as well as themselves, and who, in spite of all their ability, can never see that swift destruction treads, like Nemesis, on the heels of those who dare to trifle with the interests and destinies of a great people. His collected writings were published by Mallet (5 vols., Lond. 1753–54).

BOLIVAR, a co. in Mississippi on the M. river, 800 sq.m.; pop. '70, 9732—7816 colored. The land is low and swampy, and little cultivated. Co. seat, Rosedale.

BOLI'VAR, one of the United States of Colombia, lying on the Caribbean sea; 21,345 sq.m.; pop. '71, 247,100; chief town and capital, Carthagena. The country is level and covered with forests. Magdalena river forms its w. boundary.

BOLI'VAR CITY. See ANGOSTURA, *ante*.

BOLI'VAR, SIMON (named *El Libertador*, for having rescued South America from the Spanish yoke), was born at Caracas, July 25, 1783, descended from a noble and wealthy family. Having studied law at Madrid, he traveled extensively on the continent, married, and returned to his native country, where his wife soon after died. On her death, he again visited Europe, and in 1809 the United States, from which he returned with the determination to free his country from foreign despotism. Arriving at Venezuela, he at once associated himself with the patriots there; and after the insurrection of Caracas, April 19, 1810, he was sent to London with a view to interest the British cabinet in their aims. The British government, however, declaring its neutrality, B. speedily returned,

and fought under gen. Miranda in several successful engagements. The Spaniards having again obtained possession of Venezuela, B. had to flee to Curaçoa. He did not, however, remain long inactive. Sympathized with by the republican president of New Granada, he raised a force of volunteers; defeated the Spaniards several times, his army increasing with each victory; and on Aug. 4, 1813, entered Caracas as a conqueror, was hailed as the liberator of Venezuela, and made absolute dictator in all civil and military affairs. After defeating the Spaniards in several engagements, he was himself worsted at the battle of La Puerta, and again in Aug. at San Mateo, where he had a narrow escape. He now went to Carthagena, and afterwards to Kingston, in Jamaica, where an assassin, hired by the Spaniards, tracked his steps, but, by mistake, murdered his secretary. Having visited Hayti, and assembled there the insurgent refugees, he landed with them on the island of Margarita, Dec., 1816, where he convoked a congress, instituted a government, proclaimed the abolition of slavery, and immediately manumitted his own slaves. The following two years were marked by successes over Morillo. In Feb., 1819, a congress was opened at Angostura, and B., chosen president, was armed with the power of dictator. Having conducted his forces over the almost impassable Cordilleras to New Granada, he achieved the victories of Tunja and Bojaca, and soon afterwards declared New Granada united with Venezuela as a republic, under the name of Colombia. The office of president was conferred upon him. 1822 saw the new republic completely cleared of royalist troops, and B. was summoned the same year to help the Peruvians, and was named dictator of Peru. After two years' fighting, the Spaniards were driven from Peru also.

B. now made a tour through the southern provinces of Peru, where he was hailed with every demonstration of rejoicing. The name of the country was changed in his honor to Bolivia (q.v.), and a million of dollars was given him, which he devoted to the liberation of 1000 slaves. The Bolivian code was adopted by Bolivia in Dec., 1826, and in the following year by the congress of Lima, where B. was made president for life. In the meantime, dissatisfaction prevailed in Colombia, to which he returned, and, notwithstanding some dissent, was confirmed in the presidency in 1826, and again in 1828. About this time a conspiracy threatened his life, but was suppressed by the execution of the leaders and the banishment of seventy accomplices. Meanwhile, his famous code was renounced in Peru, and B. was rejected from the presidency. In 1829, Venezuela separated itself from the republic of Colombia, which was generally disturbed by faction, and B.'s ambition was loudly denounced. B. accordingly laid down his authority in Jan., 1830, notwithstanding earnest entreaties to retain it, and retired, in failing health, to Carthagena. The congress of Bogota voted him a pension of 30,000 piastres, and awarded him the thanks of the Colombian people. He died at San Pedro, Dec., 1830, having, shortly before his death, written a farewell address to the people of Colombia, in which he vindicated his character from the aspersions that had been cast on it, and complained bitterly of ingratitude. The war of liberation, and the peculiar elements with which he had to deal, compelled him to assume dictatorial power; but there is no proof that he was ever insincere in his devotion to liberty. His property was mainly devoted to the service of his country. He has been described as the Washington of South America. Like other great men, he was rightly estimated after his death. By a resolution of congress, New Granada, 1842, his ashes were removed with great pomp from Santa Marta to Caracas, where a triumphal arch was erected to his memory.

BOLIV'IA, or UPPER PERU, a republican state on the w. side of South America, deriving the former name from Bolivar (q.v.), and the latter from the fact that it had originally been subject to the Incas. It extends between lat. 10° and 23° s., and long. 57° 30′ and 70° 10′ w., touching the Pacific on the s.w., Peru on the w. and n., Brazil on the n. and e., and lastly, the Plate Provinces and Chili on the s.; its area, now better defined than formerly, by treaties made with Chili and Brazil in 1866 and 1867, being about 536,000 sq. miles. In 1861, the pop. of European origin was estimated to be 1,742,352; later returns give 2,000,000. The aboriginal element is by far the most important. B. is divided into the departments of La Paz, Potosi, Oruro, Chuquisaca or Sucre, Cochabamba, Beni, Santa Cruz, Tarija, and Atacama. Hydrographically, the country may be regarded as unique. Its maritime territory, known, in fact, as the Desert of Atacama, is a sandy waste, which, with the inconsiderable exception of the Loa, does not send a single stream that is worthy of notice into the Pacific. Again, the plateau, chiefly Bolivian, of Titicaca, shut out alike from either ocean, loses its entire drainage in the lake of Paria. Lastly, the region to the e. of the Andes is a cradle at once of the Plata and the Amazon, gathering for the former the Pilcomayo and the Paraguay, and for the latter the Beni, the Mamore, and the Guapai. In each section of B., the hydrography may be said to be a clue to the rainfall. On the almost riverless shore of the Pacific, the air is nearly as dry as the earth; to the e. of the mountains, the trade wind vapors from the Atlantic are copious enough not only to feed, but to flood the parent streams of the mightiest rivers on the globe; and within the valley of Titicaca, which has a minimum height of 12,441 ft., the clouds barely supply the comparatively scanty evaporation of so lofty a surface. With regard to temperature, B., almost entirely a tropical region, may claim to embrace all the zones in the world. Each locality, excepting, of course, the sandy wastes on the Pacific, has its own peculiar

vegetation. Even the arid brows of the Andes yield a coarse grass, which forms the favorite food of the guanaca, llama, alpaca, and vicunha—animals almost as independent of water as the camel. The table-land of Titicaca produces abundantly maize, rye, barley, and wheat. Hitherto, however, B. has been remarkable mainly for its mineral productions. The silver mines of Potosi, after having, on a well-founded estimate, completed the full tale of 2000 millions of dollars, are believed to be inexhaustible; while gold, lead, tin, salt, sulphur, niter, and copper are abundant. The foreign trade labors under heavy disadvantages. In the days of Spanish connection, it was almost exclusively carried on—though quite as much by land as by water—along the line of the Plata; but since then, it has found its most convenient channel through the Peruvian marts of Arica and Tacua. With the aid of steam, however, the external traffic might make for itself great highways of the Plata and the Amazon. The imports, confined to articles of the highest value or of the first necessity, are principally iron, hardware, and silks; and the exports, besides the precious metals, are copper, guano, niter, cacao, Jesuits' bark, skins, tobacco, and native manufactures. The total imports in 1875 were valued at £1,150,000; the exports at £1,000,000. In 1874, B. exported to Great Britain, copper valued at £104,638; silver, at £103,806; niter, at £116,195. The constitution of the republic, as founded by Bolivar, has suffered important modifications. According to the constitution, the executive is vested in a president, elected for four years, while the legislature consists of a congress of two chambers, called the senate and the house of representatives, both elected by universal suffrage; but in reality, the fundamental law of the republic requiring the election of the president every four years has fallen into disuse; and since the presidency of Marshal Santa Cruz (from May, 1828, to Jan., 1839), the history of B. is a history of military insurrections, the supreme power having been almost invariably seized by successful commanders. In 1873–74, the estimated revenue was £585,915, and the expenditure £901,101. The republic is burdened with an internal debt of £1,600,000, and a foreign debt, consisting of a six per cent loan of £1,700,000 nominal capital—issued at the price of 68—contracted in England in 1872, "to subsidize the National Bolivian Navigation Company." The army consists of about 3000 men. The seat of the executive government, formerly La Paz, was transferred in 1869 to Oruro. In 1879 a war broke out between Chili and B. allied with Peru. There are three short railways in Bolivia.

BOLKHOV', an ancient t. of Russia, in the government of Orel, about 30 m. n. of the city of the same name. B. is situated on the Nougra, is chiefly built of wood, has upwards of 20 churches, besides a monastery and nunnery. Its manufactures consist of gloves, hats, hosiery, leather, etc., and it has a trade in tallow, hemp, hides, and oil. Pop. '67, 18,491.

BOLL, an old dry measure in Scotland, varying in quantity according to locality and the article measured. It is sufficient to say that a B. of oats is equal to six bushels, or six-eighths of an imperial quarter. Although superseded by imperial measures, the B. is still very commonly in use; but, as in the case of all old weights and measures, bargains by it cannot be legally enforced. See WEIGHTS AND MEASURES.

BOLLAN, WILLIAM, d. 1776; an English lawyer, son-in-law of gov. Shirley of the colony of Massachusetts, and the agent to obtain from England the money advanced by the colony for the expedition against cape Breton. He favored conciliation toward the colonies, and wrote on American affairs; among other works, *Freedom of Speech, and Writing upon Public Affairs Considered,* and *Ancient Rights to the American Fishery Examined and Stated.*

BOL'LANDISTS, an association or succession of Jesuits by whom the *Acta Sanctorum* (q.v.), or Lives of the Saints of the Christian Church, were collected and published (1643–1794). They received their name from JOHN BOLLAND, b. in the Netherlands 1596, d. 1665, who, with the help of Gottfried Henschen, edited the first 5 vols., containing the month of Jan., in two vols., published in 1643, and the month of Feb., in 3 vols., published in 1658. The project had been undertaken by a Flemish Jesuit, Herbert of Rosweyd, and on his death, in 1629, his collections were intrusted to Bolland, who established himself in Antwerp, opened a correspondence all over Europe, and associated young men of his order with himself in the work. Several distinguished names are ranked among the B., as Gottfried Henschen (died 1681), Daniel Papebroek (1714), Conrad Janning (1723), Peter Bosch (1736), Suyskens (1771), Hubens (1782), Dom Anselmo Berthod (1788), and Jos. Ghesquière (1802). The abolition of the order of Jesuits in 1773 caused the removal of the Bollandist society to the monastery of Candenbeg, in Brussels, till the persecutions under Joseph II. brought about its dissolution. In 1789, the abbey of Tongerloo, in Brabant, took up the colossal task of carrying on the *Acta Sanctorum;* but scarcely had the 53d vol. appeared, in May, 1794, when the French occupation put an end to the work. It was not till 1837 that a new Bollandist association of Jesuits was formed, under the patronage of the Belgian government, which set aside a yearly sum of 6000 francs for this object. In 1845, this new society published, in two parts, the 54th vol. of the work, containing, among others, the life of St. Theresa, extending to 671 folio pages. Other volumes have since appeared, and more are in preparation, so that there is room to hope that at least the next generation may see the completion of this vast work, of which Gibbon has truly said, that "through the medium

of fable and superstition it communicates much historical and philosophical instruction." M. Guizot, having ascertained that the 3 vols. for April contain 1472 lives, estimates that the 53 vols., published before the French revolution suspended the progress of the undertaking, contain more than 25,000 lives of saints.

BOL'LINGER, a co. in s.e. Missouri on Little river; intersected by the St. Louis and Iron mountain railroad; 450 sq.m.; pop. '70, 8162. It is level with fertile soil; productions chiefly agricultural. Co. seat, Dallas.

BOLOGNA, a province of the kingdom of Italy, formerly one of the delegations of the papal states. It is bounded n. and e. by the provinces of Ferrara and Ravenna, and w. and s. by those of Modena and Florence. The area of the province is 1374 sq.m.; pop. in '71, 439,166. Sloping gradually up from the plains of Lombardy in the n., its surface becomes mountainous in the s., which is traversed by offsets from the Apennines. B. is well watered, and the streams are extensively used in the irrigation of rice-fields. It is very productive, yielding corn, wine of middling quality, olive-oil, fruit, vegetables of all kinds, hemp, flax, and saffron. Silk-worms are reared in great numbers. Marble, chalk, and gypsum are the mineral products; hemp, rice, and silk the principal articles of trade.

BOLOGNA, one of the most ancient cities of Italy, is beautifully situated on a fertile plain at the foot of the lower slopes of the Apennine mountains, in lat. 44° 30′ n., long. 11° 21′ e. It is inclosed by a high brick-wall, some 5 or 6 m. in extent, but without fortifications; the canal of Reno intersects it, and, on either side, the rivers Reno and Savena sweep past its walls. B. was, next to Rome, the most important city of the papal states. The streets in the newer parts of the city are spacious and well paved, with rich and varied colonnades, affording shelter alike from sun and rain; in the older portion, the streets are narrow, crooked, and dirty, and the arcades correspondingly low and gloomy. The city is adorned with many fine palaces of the nobility, which are rich in fresco-paintings by the great masters. Pre-eminently worthy of notice is the Piazzo Maggiore, "the Forum of B. in the middle ages," which includes, among other fine buildings, the Palazzo Maggiore del Pubblico, and the Palazzo del Podestà. Among the fine frescoed rooms and galleries of the former, that of the Sala Farnese is the most imposing; the latter is interesting as having been the prison and death-scene, in 1272, of Enzius, the son of the emperor Frederick II., and also as containing the archives of the city. The great feature of B., however, is its religious edifices, which are remarkable both for the beauty of their architecture, and the abundance and splendor of the art-treasures they contain. It has more than 70 churches, the most remarkable of which are San Stefano, which is rich in relics, ancient tombs, and Madonnas, Lombard architecture, and Greek frescoes of the 11th and 12th centuries; San Petronio—which, though unfinished, is the largest church in B.—a noble specimen of Italian Gothic, with a meridian traced on the floor by the astronomer Cassini, and numerous splendid bass-reliefs by Jacopo della Quercia and Tribolo, as well as masterpieces by other artists both in sculpture and in painting; San Domenico, with works by Michael Angelo and Niccolò di Pisa, and many other eminent sculptors, and paintings and frescoes by Guido, Francia, Lodovico Caracci, Marchesi, Simone da Bologna, Colonna, and others; and the cathedral dedicated to St. Peter, also rich in works of art, and interesting historical associations, which, indeed, cluster around all the structures mentioned. In the center of the city are two remarkable leaning towers, constructed about the beginning of the 12th c.; the tallest, called the Asinella, has a height of 256 ft., with, in 1706, an inclination of 3 ft. 2 inches. In 1813, a careful measurement showed that this inclination had slightly increased. The other tower, the Garisenda—which is alluded to in the 31st canto of Dante's *Inferno*—has an elevation of 130 ft., with a lean of 8 feet. The university of B. is said to date its origin from the 5th c., when it was founded by Theodosius II., and to have been afterwards restored by Charlemagne. It was not, however, until the 12th c., when it was founded anew by Irnerius or Wernerus, that it attained celebrity. Its reputation during that century was so great, chiefly on account of its school of jurisprudence that students from all parts of Europe were attracted to it. In 1262, the number receiving instruction is stated to have been 10,000, and it was found necessary to appoint professors specially for the students from each country. The university is also celebrated as the first school for the practice of dissection of the human body, as well as for the fact that, for centuries learned female professors have prelected within its walls. The famous linguist, cardinal Mezzofanti, was a professor here. Though the number of students is now comparatively small, the university of B. still holds a first place among Italian educational institutions. Medicine is now the principal study. The university library contains 200,000 vols., and 6000 MSS., 20,000 vols. having been presented by Benedict XIV. Many of the books are very rare and valuable. In the church of San Domenico there is a public library of 90,000 vols., accessible on holidays, when all others are closed. The Accademia delle Belle Arte is particularly rich in the works of those native artists who founded the far-famed Bolognese school of painting, and it has also some fine specimens of other schools. Besides being the birthplace of those painters that have made its name illustrious, B. gave to the pontifical chair Honorius II., Lucius II., Gregory XIII., Innocent IX., Gregory XV., and Benedict XIV.

B. has some important manufactures, including silk goods, velvet, crape, wax-candles, musical instruments, chemical products, paper, and sausages almost as celebrated as its paintings. Pop. '71, 89,104.

B. owes its origin, which is said to be much more remote than that of Rome, to the Etruscans, by whom it was called *Felsina*. It afterwards fell into the hands of the Boii, from whom it passed to the Romans, who made it a colony, under the name of *Bononia* (189 B.C.). In 53 A.D., it was nearly destroyed by fire, but was restored by Claudius. After the fall of the Roman empire, it passed into the hands of the Longobards, from whom it was taken by the Franks. Charlemagne made it a free city, and its independence was confirmed by a charter from Henry V., in 1112, which also invested the citizens with the choice of their own judges, consuls, and magistrates. The feuds of the Guelph and Ghibeline factions led to the downfall of the republic, and the supremacy of the papal see, B. being made a delegation in 1513. In 1796, B. was taken by the French, and was constituted the chief town of the Cispadane republic; and afterwards, when the kingdom of Italy was established, capital of the department Del Reno. It reverted to the pope in 1815. After that time, B. made several efforts to throw off the authority of the pope. One, in 1831, was successful, but the papal authority was restored in the following year. In 1848, the Austrians attempted to obtain possession of B., but were repulsed. In the following year, however, they succeeded in capturing the city after a siege of ten days. B. was then, like the rest of the Romagna, declared to be in a state of siege, and was made the head-quarters of the Austrian second Italian corps. From the commencement of the Italian campaign of 1859, the Bolognese gave an active sympathy to the national cause; and long before the peace-negotiations at Zurich had been brought to a close, they had intimated their intention of placing themselves under the rule of Victor Emmanuel, as a part of the new kingdom of Italy. Notwithstanding the menaces of the Vatican, they persisted in their resolve; and when the question of "annexation to Piedmont, or separate government," was submitted to the universal vote of the people, in Mar., 1860, the votes for annexation exceeded those for separate government in the proportion of 1000 to 1.

BOLOGNA, GIOVANNI DA, 1524–1608; an Italian sculptor and architect, whose only superior was Michael Angelo. He designed the fountain in Bologna and its celebrated figure of Neptune. At Florence may be seen his "Rape of the Sabine Women," and a bronze statue of Mercury. He was extensively employed in important public works.

BOLOGNA PHIAL, or PHILOSOPHICAL PHIAL, is a short, thick, narrow glass vessel, close at one end, and open at the other, which the glass-blower prepares from each pot of metal before employing it in the fashioning of tumblers, glasses, bottles, etc. See GLASS. It serves the purpose of enabling the glass manufacturer to judge of the color and other conditions of the fused glass or metal; and as the jar is not subjected to annealing, it is very friable, and a small angular fragment of any mineral allowed to drop into it, at once causes it to fly in pieces. It is curious to notice, however, that a B. P. will bear a very heavy blow on the outside without being fractured.

BOLOGNA STONE, an old popular name of a radiated variety of heavy spar, or sulphate of barytes (see BARYTES), found near Bologna, which is phosphorescent in the dark. It has been also called Bologna phosphorus; but this name more strictly belongs to it when calcined, pulverized, and made into little cakes with gum-water. These, after being exposed to a vivid sunlight, are very phosphorescent, either in the air or under water.

BOLOGNESE SCHOOL OF PAINTING. Franco, who was commended by Dante for superiority in missal-painting, and who has been called the Giotto of his school, is the supposed founder of the style of the Bolognese painters of the 14th century. Many of their now fading works exist in the church di Mezzaratta, a gallery, as it were, of ancient specimens, which is to this era of the Bolognese school what the Campo Santo at Pisa is to that of the Florentines. About 1500, the most prominent name is Lippo Dalmasio, some of whose works remain. Malvasia relates, with reference to one in the church of S. Procolo, that he heard Guido extol its purity and grandeur of expression, and assert that no modern painter could infuse so holy a feeling into similar subjects. Francesco Francia, who was contemporary with Raphael, and survived him some years, is celebrated as a painter who succeeded beyond most others in giving an expression of sanctity and purity to his madonnas, and a letter of Raphael's is extant in which this merit is particularly alluded to. His eulogists, however, have vainly endeavored to exalt him to a level with Raphael or Titian. Niccolo dell' Abate is associated with the Bolognese painters by some works at Bologna, by his joint labors with Primaticcio at Fontainebleau, and by the extravagant compliment paid to him in a sonnet by Agostino Caracci as uniting in himself all the excellences of all the great masters. Pelligrino Tibaldi, a pupil of Michael Angelo, is another celebrated name. The Caracci, of whom we shall soon speak, honored him with the appellation of "the reformed Michael Angelo." Baroccio led the way, about 1565, in including Correggio among the great models to be imitated, and we find that Ludovico Caracci, and his younger cousins Agostino and Annibale Caracci united their efforts to introduce a new style patterned in some respects after that great master. They founded a school of instruction which exerted a great influence. The fame of the Caracci was soon estab-

lished by their works; but the opposition of the abettors of the old school was not silenced until the frescos in the Palazzo Magnani were executed. The constant reference of these masters to nature was the point of objection on the part of the old school. Annibale Caracci painted in various churches in Rome; but his great work, the monument of his powers and the specimen of the school most frequently quoted, and in which Agostino assisted, is the series of frescos in the Farnese palace. The followers of Ludovico at Bologna were true to the founder of the school, and posterity seems to have decided that he was more original than Annibale. Sir Joshua Reynolds praised "his unaffected breadth of light and shadow, the simplicity of the coloring," and "the solemn twilight" diffused over his pictures, as corresponding better with grave and dignified subjects "than the more artificial brilliancy of sunshine which enlightens the pictures of Titian." Indeed, the principles and practice of these Bolognese masters and their scholars superseded for a time every other style in Italy. Among the numerous scholars of the Caracci, Domenichino holds the first rank. He was declared by Poussin to be the greatest painter after Raphael, and by some modern critics he has been preferred to the Caracci themselves. Among the other eminent painters of the Bolognese school are Guercino, Lanfranco, Tiarrini, Lionello Spada, Cavedone, and Carlo Cignani. During the present century the school has lost something of its former high rank. The British national gallery contains more than twenty pictures by artists of this school.

BOLOR-TAGH', a supposed lofty mountain-chain of Central Asia, extending from lat. 35° to 45° n., and from long. 70° to 75° e., which was said to divide Turkestan into an esstern and western portion. Conjecture even went so far as to assign to its highest points an elevation of 19,000 feet. It was described as dividing Turkestan (q.v.) into two parts, and being connected with the Thian-shan range and others farther north, as well as with the Hindu Kush on the south. Recent explorations have shown, however, that no such range exists, but that there is a lofty plateau which in part corresponds to its supposed position.

BOLSE'NA, an Italian t., in the province of Rome, about 20 m. n.n.w. of the town of Viterbo. It is situated on the n. shore of the lake of Bolsena (*lacus Volsiniensis*), on the road from Florence by Siena to Rome. It has now little more than 2000 inhabitants; but in early ages it was a place of great importance, forming one of the twelve Etruscan cities, under the name of Volsinii. When finally subjugated by the Romans (280 B.C.), as many as 2000 statues are said to have been taken from it; but, though this is doubtless an exaggeration, we may gather from it that the Volsinians had achieved a high reputation for wealth and artistic skill. The Romans razed the Etruscan city to the ground, but built another in its place, which, however, is not much celebrated in history, except as the birthplace of Sejanus, the favorite and minister of Tiberius. Pliny records that it was the scene of supernatural occurrences, king Porsenna having here called down fire from heaven to destroy a monster, Volta, that was ravaging the surrounding country. In later ages, according to the traditions of the Roman Catholic church, a doubting Bohemian priest was here convinced of the truth of the doctrine of transubstantiation, by witnessing the flow of blood from the host he was consecrating; and in commemoration of this supernatural occurrence, Urban IV. instituted the festival of the Corpus Domini. Raphael has immortalized the incident. Half a mile from B. are a few traces of the Etruscan city, and many fragments of the Roman one remain. The lake Bolsena is a fine expanse of water about 10 m. long and 8 broad, but its shores are very unhealthy. The Marta river carries its waters into the Mediterranean. It has two islands, Bisentina and Martana, which were favorite autumnal retreats of pope Leo X. Martana is famous as the scene of the exile and murder of the Gothic queen Amalasontha, by her cousin Theodatus.

BOLSWARD' (Lat. *Bolverda*), an old t. in the Netherlands, province of Friesland, lies 15 m. s.w. from Leeuwarden. It is surrounded by a high earthen wall and broad canal The church of St. Martin, in the Gothic style, is the largest and handsomest in Friesland. There are several benevolent institutions, and a grammar-school. The trade is chiefly in butter, cheese, and cattle. Ship-building, tanning leather, making brick and coarse pottery, spinning worsted, carding wool, etc., are the principal industries. Pop. '76, 5181.

BOLTON (-LE-MOO'RS), an important English manufacturing town, in South Lancashire, on the Croal, 11 miles north-west of Manchester. It was celebrated as far back as the time of Henry VIII. for its cotton and its woolen manufactures, introduced by Flemish clothiers in the 14th century. Emigrants from France and the palatinate of the Rhine subsequently introduced new branches of manufacture; and the improvements in cotton-spinning of the middle of the 18th c., rapidly increased the trade of the town. Though Arkwright and Crompton belonged to B., the opposition of the working classes long retarded the adoption, in their native town, of their inventions—the spinning-frame and the mule. B., containing more than 70 cotton mills, with 2½ million of spindles, is now one of the principal seats of the cotton manufacture in Lancashire. Muslins, fine calicoes, quiltings, counterpanes, dimities, etc., are manufactured. There are 40 foundries and iron-works, and numerous dye-works. The lexicographers Ainsworth and Lempriere were masters of B. grammar-school. During the civil war, the parliament garrisoned Bolton. In 1644, it was stormed by the earl of Derby; and after the battle

of Worcester, that unfortunate nobleman was beheaded there. Pop. '71, 92,655. Since 1832 it has returned two members to parliament. B. parish has numerous coal mines. Between B. and Wigan much cannel-coal occurs, and is often made into snuff-boxes, candlesticks, etc.

BOLT-ROPE, in the rigging of a ship, is the rope to which the edges of sails are sewn, to strengthen and prevent them from tearing. It is of three kinds, according to its position—a *leech*-rope up the perpendicular edge of the sail, a *foot*-rope along the bottom edge, and a *head*-rope along the top edge. Some sails, owing to their shape, have no head-rope. All the cordage employed in furling and unfurling the sail is fastened to the bolt-rope.

BOLTS, in ship-building, are usually either of iron or copper; they are employed either for bolting together certain of the timbers, or for fastening any loose body. The B. are of various sizes and shapes, and the heads variously fashioned, according to the services to be rendered. The heads are named "common," "saucer," "collar," "tee," "calking," "conical," etc. The B. vary from half an inch to nearly three inches in diameter, and from a few inches to many feet in length. The longest are driven through the dead-wood and through the knee of the head; others are used for securing the great guns, the stoppers of the cable, etc.; but the greater number penetrate the timbers of the ship. Some of the smaller are secured at the points by riveting, clinching, or forelocking.

BOLUS (Gr. *bolos*, a clod or lump), a soft mass of any kind of medicine, intended to be swallowed at once; a B. differs from a pill in being larger.

BOLZA'NO, BERNHARD; 1781–1848; a Roman Catholic theologian and philosopher. At 24 he took orders and was appointed professor of the philosophy of religion at the philosophical faculty in Prague. In his lectures he endeavored so to present the Roman Catholic theology as to show its complete harmony with reason, but his views met with much opposition. In 1820, he was accused of connection with some students' societies, and was compelled to resign. Several doctrines found in his works were condemned at Rome, and he was suspended from his priestly functions. The remainder of his life he devoted to literary work. He left 25 volumes, on logic, on the philosophy of Roman Catholic dogmas, on mathematics, and on autobiography.

BO'MARSUND. See ALAND ISLANDS.

BOMB, a missile which also receives the names of *bomb-shell* and *shell*. It is a hollow ball, usually of cast iron, fired from a mortar or other large piece of ordnance, and filled with combustibles which work great havoc when the ball bursts by the firing. All such projectiles were formerly fired from mortars only, and there was thus a definite relation between the B. and the mortar; but since the invention of shell-guns, and other modern pieces of artillery, the name *shell* has been generally substituted for that of *bomb*. The 13-inch B., which is the largest size used in ordinary warfare (instances of exceptional magnitude are noticed under MORTAR), weighs about 195 lbs., with a thickness of metal varying from 1¼ to 2 in. at different parts; it bursts with about 8 lbs. of powder. The vent through which it is filled with powder is, after the filling, closed with a plug called a *fuse*, which sets fire to the powder, and at the proper moment bursts the B. into fragments. The 10-inch B., weighing about 90 lbs., is proportionably less in all dimensions than that just described; and so on for those of smaller diameters. It should be understood, however, that the above are conventional quantities prescribed and adopted more than half a century ago. Modern artillerists try experiments on bombs of various degrees of thickness, and various charges and fuses. Some of the results of these experiments, and some of the modern achievements in B. practice in actual warfare, are noticed under MORTAR and SHELL.

BOMBA, a kind of nickname given to Francis II., king of Naples and Sicily, in consequence of his cruel bombardment of Messina, in Sept., 1848, in which the slaughter and the destruction of buildings was immense.

BOMBA'CEÆ. See STERCULIACEÆ.

BOMBARD, among the now disused engines of war, was a piece of ordnance very short, thick, and wide in the bore. It differed from the balista (q.v.) in being worked with gunpowder instead of by mechanical force; and from the mortar, in shooting forth stones instead of iron shells. Some of the bombards used in the 15th c. propelled stones weighing from 200 to 500 lbs. each.

BOMBARDIER is an artilleryman versed in that department of arms which relates especially to bombs and shells, mortars and howitzers, grenades and fuses. He has learned to load shells and grenades, fix fuses, prepare composition for fuses and tubes, etc.; and on the field or at sieges, he fires the mortars. In some foreign armies, the bombardiers form a separate corps; but in the English army, there are some attached to every battery.

BOMBARDIER BEE'TLE, a name common to many species of coleopterous (q.v.) insects of the genera *brachinus* and *aptinus*, of the tribe *carabidæ* (q.v.). They have received this name in consequence of the remarkable power which they possess of discharging, for their own defense, an extremely acrid volatile fluid from the abdomen,

which diffuses around them a pungent odor, and which explodes on coming in contact with the air. The species of the genus *aptinus* have no membranous wings beneath their elytra; those of the genus *brachinus* have. Both are found chiefly under stones. The large and more brilliant species are tropical. Several small species of *brachinus* are natives of England. The most common English species is only about four lines long. When roughly handled, it will make more than a dozen discharges in rapid succession. When the reservoir which contains the liquid is opened by dissection, it effervesces and evaporates instantaneously. It changes blue vegetable colors to red, and then to yellow; produces sharp pain when applied to the tongue; and leaves a yellow spot upon its surface, like that produced by a drop of nitric acid.

BOMBARDMENT is an attack upon a fortress or fortified town by means of shells, red-hot shot, carcasses, rockets, etc., to burn and destroy the buildings, and kill the people. A bombardment is most likely to be successful when the place is destitute of bomb-proof cover; or when the governor is too humane to expose the unoffending inhabitants to this dreadful ordeal; or when the population is strong enough to compel him to yield. A bombardment requires little engineering science; whereas to reduce a place by regular siege requires the aid of engineers to direct the attack against fortifications, guns, and soldiery, leaving the inhabitants and buildings untouched. Military engineers generally regard a B. as a cruel operation; it is especially directed against the civilians and their buildings, as a means of inducing or compelling the governor to surrender the place, and terminate their miseries. In a well-defended place, the soldiers, the ammunition, and the defense-works suffer comparatively little, seeing that the bombardiers aim at pitching their terrible missiles into the heart of the place. In modern times, a B. is mostly adopted as an adjunct to a siege, distracting the governor by an incessant fire of mortars day and night. At Sebastopol, for instance, the mortars fired shells into the center of the city, to weaken the defense of the forts which were cannonaded by the siege-guns. B. is more frequently a naval than a military operation. The stores required for a vigorous B. are immense. Thus, in 1759, Rodney threw 20,000 shells and carcasses into Havre; in 1792, the duke of Saxe-Teschen threw 36,000 shot and shell into Lille in 140 hours; in 1795, Pichegru threw 8000 shells into Mannheim in 16 hours; and in 1807, the English threw 11,000 shot and shell into Copenhagen in 3 days.

BOMBAX. See SILK-COTTON TREE.

BOMBAY, an island of 8 m. by 3, on the w. of Hindustan, having its southern extremity in lat. 18° 57′ n., and long. 72° 52′ e. It consists of two rocky ridges, which embrace a valley so low as to require embankments against the tide. Its productions, of course, are scanty and unimportant. The rain-fall, with an annual mean of 80 inches, gave, in 1831, 99·64, and in 1838, only 50.78. The temperature, ranging between 70° and 100°, averages, during the year, about 80°. The climate, at one time very unhealthy, has latterly been so much improved by drainage and other appliances, that, in favorable seasons, the proportion of deaths is said very little to exceed that of London. In 1509, about a year before the capture of Goa, the Portuguese visited the island; and by 1530, they had made it their own. In 1661, they ceded it to Charles II. of England, as part of the dowry of his bride, the Infanta Catherine. In 1668, his majesty granted it to the East India company, which, in 1685, transferred what was then its principal presidency to B. from Surat. The name of the island, though manifestly a corruption of the native *Mambai*, may yet, with reference to the goodness of the harbor, have owed its specific form to the Portuguese *buon bahia*. The bay towards the main-land, even in its natural state, presents one of the finest havens in India, more particularly as being one of the few on the e. side of the Arabian sea which are accessible during the s.w. monsoon. Anchoring-ground, of about 50 sq.m., available for vessels of any burden, is sheltered on the n. by Trombay and Salsette, and on the w. by B. itself and its two insular appendages—Old Woman's isle and Colaba; and lastly, the open passage at the s., which thus makes an entering wind of the monsoon already mentioned, is narrowed on the e. by the island of Caranja. Art also has done much to aid nature. The island on the n. and w.—all but Trombay, which, in fact, is itself inclosed—are welded into one by three causeways; while at the s. end of this continuous breakwater, the light-house of Colaba, 150 ft. high, indicates to mariners the entrance of the port along a radius of 20 miles.

BOMBAY (Presidency) has become what it is mainly in the present century. During ninety years, it was confined, with now and then a temporary and insignificant exception, to the island and the two rocky islets on the south. Even the adjacent islands, such as Salsette and Caranja, were acquired only in 1775—the very year in which a younger presidency, after absorbing Bengal, Bahar, and Orissa, annexed Benares. With the exception of the detached territory of Sinde, this presidency, reared principally at the expense of Mahratta dominion, physically divides itself into three parts: the two Concans, between the western Ghauts and the Arabian sea; the eastward slope of the western Ghauts; and, to the n. of both these divisions, the alluvial tracts towards the mouths of the Taptee and the Nerbudda. Of these three regions, the first, though in a higher latitude than the second, is by far the hottest—its temperature occasionally reaching 115°. The first two differ widely as to rainfall. In the Concans, the vapors of the s.w. monsoon, intercepted by the mountains, have been known to yield, at three different places in the same year, 106, 130, and 248 in.; while, almost as a neces-

sary consequence, the eastward slope is generally liable to suffer from droughts. Without anticipating details, which will be given under the respective districts, it may be stated that B., including Sinde, contains 188,195 sq.m., of which 63,523 are in native states, with (1872) 25,624,696 inhabitants. The British part of the presidency has an area of 124,443 sq.m., and a pop. of 16,352,623. The revenue is about £10,000,000, and the expenditure about £1,000,000 less. The administration is vested in a governor and three councilors, subject, however, to the control of the governor-general of India. The ecclesiastical establishment consists of a bishop of the church of England, who has under him an archdeacon and many clergymen; and a number of chaplains of the church of Scotland. The schools are of two classes—seminaries under the various missions, and schools managed by a board of education—the latter being by far the more numerous. The majority of the scholars use merely the vernacular tongues. In 1872–73, the entire number of schools and colleges aided by government, or under its inspection, was 4088, with 218,466 pupils. The university of B. was founded in 1857; 203 candidates passed for admission in 1876. In 1871, the B. army consisted of 10,583 European soldiers, with 1312 officers, along with 27,107 native officers and men. During the mutiny of 1857, the local army remained, on the whole, steady and faithful; and it was, in fact, a portion of it which, under sir Hugh Rose, acted, if not actually the first, at least the second part in the suppression of the insurrection. It is to this presidency that the naval force for all the presidencies belongs. To the island of B., as to Great Britain itself, "wooden walls" were from the beginning a necessary of life, more especially on waters proverbial for piracy from time immemorial. Accordingly, from 1670 onwards, the company's navy have done battle for the crown. B. has benefited vastly from the establishment and extension of the Indian railway system. The first railway in Hindustan was opened in B. in 1853. There are now five main railway lines in B., giving direct communication with Ahmedabad, Calcutta, and Madras. A cable telegraph from B. to Aden was laid in 1869. Of late years, the manufacturing industries have been extremely active in Bombay. Many great cotton-mills have been erected; and the presidency, commanding, as it does, the richest cotton-fields in India, has improved to the utmost its natural advantages, by adding English machinery to its cheap labor and ready material. Government has been liberal in supplying money for public works.

BOMBAY (City) occupies the entire breadth of the s. end of the island, bordering at once on the harbor inside, and on Back bay outside. Next to Old Woman's isle, which, along with Colaba, may be regarded as a suburb, is the European town; about a mile to the n. is the much larger Black town; and between them is the esplanade with the barracks and the railway terminus. The pop., which is exceedingly heterogeneous and dense—as many as 31 persons, on an average, inhabiting each house—amounted, in 1872, to 644,405. The Hindus form the largest section; the Parsees number about 50,000; and the rest are Mussulmans, native Christians, Europeans, Indo-Portuguese, Jews, etc. Amid these various classes, the Parsees or Persians, descendants of fire-worshipers driven from their homes by Mohammedan bigotry, rank next to the English, grade for grade, in respectability and influence. The late sir Jamsetjee Jeejeebhoy, in fact, stands forth, to say nothing of fabulous wealth, as the faultless model of a merchant-prince in enterprise and integrity, in munificence and patriotism; and ever since the introduction of the ship-building business in 1735, the Lowji family, assisted chiefly by operatives of the same race, has been at the very head of this, one of the most important interests of the city—not merely the Indian navy, to be noticed more at large under the next subdivision, but likewise several imperial men-of-war, both frigates and line-of-battle ships, having been almost exclusively the work of Parsees. Besides the dock-yard, which covers about 200 acres, at the s.e. of the European town, the objects most worthy of note are the town-hall, the library of the Asiatic society, the mint, cathedral, and custom-house; the post-office, and public works office; the missionary houses, the Elphinstone institution, the Grant medical college, the university, and Sassoon's high school; the Jamsetjee hospital, and the Jamsetjee obstetric hospital. The city also possesses a chamber of commerce, offices of the Agra bank, government savings-bank, B. steam-navigation company, and several insurance companies. Always favorably situated for foreign trade, B. has profited largely by the reopening of the ancient thoroughfare through Egypt, as saving more distance in proportion than any other emporium in the east, and also as being on the direct line between Madras and Calcutta on the one side, and Aden on the other. When the civil war in the United States caused a sudden cessation of the American supplies, cotton began to be exported from B. in vast quantity; and although the reopening of the southern ports soon checked the extraordinary activity of trade, B. was permanently benefited by the stimulus its commerce then received. It now presses Calcutta closely as the commercial capital of India. Its exports in 1875 amounted to £25,294,992; its imports to £16,501,002. The chief articles of export are cotton, shawls, opium, coffee, pepper, ivory, and gums; the chief imports, piece-goods, thread, yarn, metals, wine, beer, tea, and silk. The chief mail line to India is now by Suez, Aden, and B.; and from B., letters are sent to Calcutta, Madras, etc.

BOMBAY ARMY. See EAST INDIA ARMY.

BOMBAY DUCK. See BUMMALOTI.

BOMBAZINE is a plain fabric of cloth, for dresses, in which the distinguishing characteristic is that the warp is silk and the weft worsted. The cloth has thus a bare look. It is rather fine and light in the make, and may be of any color; and is about 24 in. in width. The fabric is now little used. It was extensively made, and chiefly at Norwich, from about 1816.

BOMB LANCE, a sharp-pointed projectile used in whale fishing, charged like a grenade, and shot from a musket, the slow fuse that explodes it being first lighted. Its power is sufficient to stun the whale.

BOMB-PROOF BUILDINGS are military structures of such immense thickness and strength that bomb-shells and cannon-balls cannot penetrate them. Two of the chief kinds will be found noticed under CASEMATE and MAGAZINE.

BOMB-VESSEL. The various kinds of *B.*, *bomb-ketch*, *mortar-vessel*, and *mortar-boat*, may all be conveniently described under MORTAR-VESSEL.

BOM'BYX. See SILK-WORM.

BOM JARDIM (i.e., Good Garden), a t. of Brazil, in the province of Ceara, 20 m. s. by e. from Crato, in a rich and beautiful mountain valley. It is the center of an extensive district, yielding mandioc, sugar, etc. Pop. 6000.

BOMMEL (Dutch, *Zalt-Boemel*), a t. in the Netherlands province of Gelderland, situated on the Waal. The wide streets and houses, with gardens attached, give the town a pleasant appearance. Besides a large trade in farm produce, book-printing, making soap, beer, leather, nails, tinned pans, cigars, weaving silks, and ribbons, etc., are carried on. There is a Reformed, a Roman Catholic church, a synagogue, and grammar-school. The former defenses are now promenades. Pop. 4282. B. is a station on the railway from Utrecht to Bois-le-duc.

BOM'MELERWAARD, an island in Dutch Gelderland, formed by the Waal and Maas. It contains 12 parishes, is 16 m. in length, and its greatest breadth is 6 miles. Pop. 19,056, two thirds of whom are Protestants. The district is extremely fertile, and besides other farm produce, flax and hops are largely grown. The town of Bommel is situated in the island, which contains many thriving villages. Fort St. André defends it on the e., and Fort Loevesteen on the w.

BO'NA, a seaport t. of Algeria, in the province of Constantine, situated on a bay of the Mediterranean, in lat. 36° 54′ n., long. 7° 46′ e., and known among the Arabs by the name of Beled-el-Areb. The town, divided into two parts, upper and lower B., is situated in a beautiful, but unhealthy district, at the foot of a hill near the embouchure of the Sebus; is surrounded by walls flanked with square towers, and further defended by Fort Cigogne, on the top of the hill. Pop. '72, 16,196. Since the occupation of B. by the French in 1832, the town has been much improved, and has now good bazaars, shops, markets, reading-rooms, etc.; manufactures of tapestry, saddlery, and native clothing, and a trade in wool, hides, corn, coral, and wax. A telegraph cable was laid between B. and Marseilles in 1870; and there is regular steam communication with France, Algiers, and Tunis. Among the public buildings, the Catholic church, and the convent of the sisters of mercy, are most remarkable. Near B. are some scanty remains of the once famous city Hippo Regius, the favorite residence of the Numidian kings, and the episcopal see of St. Augustine, who died here in 430. This city was probably connected with the ancient *Aphrodisium* (the present Bona) by a canal, of which the outline may still be seen in a morass. Hippo Regius, in early Christian times, was the central station of commerce and civilization in n. Africa, and was celebrated for its schools, theater, acqueducts, palaces, and temples, afterwards changed into churches and monasteries. It was totally destroyed by the Mohammedans under caliph Osman in 646.

BO'NA, itself a Latin vocable, literally signifying "goods," and often used in pleading, and otherwise technically to designate personal estate, has several applications in the law of England, of which the following are instances: *Bona confiscata* are forfeitures of lands and goods for offenses, and form a branch of the ordinary revenue of the crown. *Bona notabilia* are chattels to the value of 100*s.*, or personal estate of £5 or upwards, excepting in London, where the sum is £10. Where such small estate was in different dioceses or jurisdictions, it was to be proved in the prerogative court of the archbishop of the province; and so late as the year 1847, an act of parliament was passed (10 and 11 Vict. c. 98), by the 4th section of which it is enacted that the law of bona notabilia should be continued unaltered. But now, by the 20 and 21 Vict. c. 77, amended by the 21 and 22 Vict. c. 95, the whole jurisdiction and authority in relation to granting administration is exercised by the new court of probate. *Bona vacantia*, or stray goods, such as wrecks, treasure-trove, waifs, and estrays, contrary to the general rule, which gives such things to the finder—vest in the crown. *Bona waviata* are also given to the crown.—They consist of goods waived or thrown away by a thief in his flight, for fear of being apprehended.

BONA, GIOVANNI, 1609–74; an Italian cardinal, author of *De Principiis Vitæ Christianæ*, and a work on the liturgy which is accepted as authority. He was also a co-worker in the *Acta Sanctorum*.

BO'NA DE'A (the good goddess), a mysterious Roman divinity, who is variously described as the wife, sister, or daughter of Faunus. She was worshiped at Rome from the most ancient times, but only by women, even her name being concealed from men. Her sanctuary was a grotto on Mons Aventinus, which had been consecrated to her by the virgin Claudia; her festival, however (the 1st of May), was not celebrated there, but in the house of the consul, inasmuch as the sacrifices were then offered up for the whole Roman nation. The solemnities were performed generally by aristocratic vestals. At this celebration, no males were allowed to be present; even portraits of men were veiled. The wine consumed was called milk, in order that its name might not be discovered, and the vessel in which it was served *mellarium*. The symbol of the goddess was a serpent, indicating her healing powers, and certain herbs were sold in her temple.

BO'NA FI'DES, a Latin expression literally signifying good faith, enters largely into the consideration of legal questions, particularly matters of agreement, contract, damage, trusts, and other departments of the law; and in all of them it implies the absence of fraud, or unfair dealing or acting. This term, however, does not appear to occupy any formal or technical place in the law of England. It is the foundation of many just and enlightened maxims in the Roman jurisprudence, which in this respect, as in many others, has been followed by the legal system of Scotland. In the law of that country, a person who possesses and enjoys property upon a title which he honestly believes to be good, although it may be bad, is protected against the consequences of this illegal position by his *B. F.*, and he is entitled to retain the fruits or profits which he has reaped or received during his *bona-fide* occupancy. But such *B. F.* ends when the possessor becomes aware of the insufficiency of his title, whether by private knowledge or otherwise. In the Scotch law, again, while *B. F.* gives no support to the parties, or either of them, in a second marriage, the first subsisting, it would, it is thought, have the effect of rendering the children of such second marriage—that is, children born while the *B. F.* continues—*legitimate*. The reason of this is, that legitimacy in Scotland is not the result merely of a lawful marriage, but may be otherwise acquired; and no offense against the laws being intended by one or both of the parties, it is inexpedient to impose bastardy on the issue. The contract itself is null, because, otherwise, a sanction would be given to bigamy. But the contract having been entered into *in bona fide*, the law considers that it ought to attribute to it all the effects of a valid marriage; and such appears to have been the Scotch law from very ancient times. The law of England is not so indulgent, for there, children born under such circumstances would certainly be deemed bastards. See BASTARDS, BASTARDY; and see on the subject of this article generally, CONTRACT, DAMAGE, MARRIAGE, GUARDIAN, EXECUTOR, TRUSTEE.

The interpretation of the term *bona fide traveler* has given no little trouble to the magistrates of Scotland in reference to the famous "Forbes Mackenzie Act" (q.v.).

BONALD, LOUIS GABRIEL AMBROISE, Vicomte de, a celebrated publicist, was b. in 1753 at Monna, near Milhau, in Aveyron. Compelled to emigrate during the French revolution, he joined the emigrant corps, and, when it was dissolved, removed to Heidelberg, where he employed his pen in the composition of politico-philosophic works on behalf of monarchy. His first important work, *Théorie du Pouvoir Politique et Religieux* (3 vols., 1796), was seized by the directory. It prophesied the restoration of the Bourbons. Having returned to France, B. was induced to accept the patronage of the Bonaparte family, and in 1808 was appointed minister of instruction. In 1816—as deputy for his department—he voted with the ultramontane or theocratic party in the *Chambre Introuvable* (q.v.), and was one of the most influential members of the chamber of deputies in abolishing the revolutionary law of divorce, against which he had written in 1806; in opposing all projects of electoral reform, the alienation of forests, the efforts to get rid of the Swiss mercenaries, the freedom of the press, etc. In 1823, he was elevated to the peerage by Louis XVIII. The July revolution brought his public career to a close, as he refused to take the oath of allegiance to the new dynasty. He died at Monna, 1840. His most important writings are: *Législation Primitive* (3 vols., Par. 1802), and *Recherches Philosophiques sur les Premiers Objets des Connaissances Morales* (2 vols., Par. 1818), which have been immensely applauded by his own party. Their non-agreement with the fundamental facts of history has been proved by impartial criticism. His florid and incorrect style is often detrimental to his logic; and even his admirers must admit that his faith in papal infallibility, and his veneration of the Jesuits, were carried beyond all reasonable bounds. A complete edition of his works, in 12 vols., was published under his own supervision (Par. 1817–19).—His son, LOUIS JACQUES MAURICE B., archbishop of Lyons, 1839, made a cardinal in 1842, faithfully adhered to his father's political and religious principles. He died Feb. 24, 1870.

BONAPARTE (pron. in Ital. in four syllables; in Eng., usually in three), FAMILY OF. In the 13th c., and afterwards, several families named B. appear in Italian records—at Florence, San Miniato, Sarzano, and Genoa; and towards the close of the 15th c., a branch of the Genoese B. family settled at Ajaccio, in Corsica, where they occupied a respectable position as patricians, *padri del commune* or *cittadini*, in the middle of the

16th century. In the 18th c., this family was represented by three male descendants, all residing at Ajaccio: the archdeacon, Lucien B.; his brother, Napoleon B.; and their nephew, Charles.—CHARLES BONAPARTE, father of the emperor Napoleon, was born Mar. 29, 1746; studied law at Pisa; and married in 1767—without the consent of his uncles—a beautiful young patrician, named Letizia Ramolino. In 1768, he removed with his family, accompanied by his uncle Napoleon, to Corte, in order to assist gen. Paoli in defending the island against the French invasion. As the French prevailed, and further resistance was useless, Charles B. attached himself to the French interest, and in 1771 was included by Louis XV. in the election of 400 Corsican families to form a nobility. In 1773, through the influence of Marbœuf, governor of Corsica, Charles B. was appointed royal counselor and assessor of the town and province of Ajaccio. In 1777, he was a member of the deputation of Corsican nobles to the court of France. In this capacity he resided for some time in Paris, where he gained for his son Napoleon, through the interest of count Marbœuf, a free admission into the military school at Brienne. In 1779, he returned to Corsica, and in 1785 went to Montpellier, for the benefit of his health, where he died of cancer in the stomach, Feb. 24, 1785. He was a man of prepossessing exterior and amiable character. By his marriage with Letizia, he left eight children: Joseph B., king of Spain; Napoleon (q.v.), emperor of the French; Lucien B., prince of Canino; Maria Anna (afterwards named Elise), princess of Lucca and Piombino, wife of prince Bacciochi; Louis B., king of Holland; Carlotta (afterwards named Marie Pauline), princess Borghese; Annunciata (afterwards named Caroline), wife of Murat, king of Naples; Jerome B., king of Westphalia. These members of the B. family, with the children of Beauharnais (q.v.), adopted by the emperor Napoleon when he married Josephine, are distinguished as the *Napoleonidæ* of modern French history. By a decree of the senate, Nov. 6, 1804, the right of succession to the throne was restricted to Napoleon and his brothers Joseph and Louis, with their offspring. Lucien and Jerome were excluded on account of their unequal marriages. Napoleon intended to give the right of succession also to Lucien, by the additional act of April 22, 1815; but this was never concluded. As Joseph, the eldest brother of the emperor, had no son, the descendants of Louis became nearest heirs to the throne.—MARIA LETIZIA RAMOLINO, mother of Napoleon I., lived to see her family placed on the thrones of Europe, and also witnessed their downfall. She was born at Ajaccio, Aug. 24, 1750. After the death of her husband, she lived for some time in Corsica, and in 1793, when the island came under British rule, removed with her family to Marseilles, where she lived in poverty, mainly supported by the pension given to Corsican refugees. After her son became first consul, she removed to Paris, and when her son was crowned in 1804, received the title madame mère. A brilliant court-household was given to her, which, however, was never pleasing to her modest tastes. Remembering former adversities, and foreboding reverses of the splendid success of her sons, she was prepared for all that followed. After the downfall of Napoleon, Letizia lived with her step-brother, cardinal Fesch, in winter at Rome, and in summer at Albano, and submitted to her change of fortune with remarkable dignity. She died Feb. 2, 1836, leaving a considerable property, the result of saving habits during prosperity.

BONAPARTE, JOSEPH, eldest brother of Napoleon, was b. at Corte, in Corsica, Jan. 7, 1768, and was educated at Autun. On the death of his father, he returned to Corsica, exerted himself to support the younger members of the family, and removed with them to Marseilles in 1793. In 1797 he was elected a member of the council of five hundred, and in the same year was sent as ambassador from the republic to Rome. In 1800, after he had proved his ability in several offices of state, he was chosen by the first consul as plenipotentiary to conclude a treaty of friendship with the United States of North America. He signed the treaty of peace at Luneville, Feb. 9, 1801, and that of Amiens, 1802; and with Cretet and Bernier conducted the negotiations relative to the *concordat*. After the coronation of Napoleon, new honors fell to the share of Joseph B., who was made commander-in-chief of the army of Naples; in 1805, ruler of the Two Sicilies; and in 1806, king of Naples. Though, during his reign, some beneficial changes of government were effected—such as the abolition of feudality, the suppression of convents, the formation of roads, the repression of banditti, the organization of laws, etc.—yet these reforms were not managed judiciously; and the collision that frequently occurred between his own humane endeavors and the reckless promptings of his imperial brother, who looked upon Naples simply as a province of the French empire, exposed only too well to the Neapolitans the weakness and dependence of their new sovereign. But, in truth, he was far too fond of the fine arts to be a vigorous ruler in stormy times; and he is accused of leaving affairs too much in the hands of his minister, the subtle Salicetti. In 1808, Joseph B. was summarily transferred by his brother to the throne of Spain, and Murat took his place as king of Naples. For Joseph, this was no favorable change: he found himself unprepared to cope with the Spanish insurgents, and after the defeat of the French at Vittoria, he returned to his estate at Morfontaine, in France. In 1813, when Napoleon recognized Ferdinand VII. as king of Spain, Joseph B. refused, at first to abdicate, though he had many times before implored his brother to release him from his royal chains; but he soon submitted, as in all other matters, to the emperor's will.

After the battle of Waterloo, he accompanied Napoleon to Rochefort, whence they intended to sail separately for North America. In his last interview with Napoleon,

Joseph generously offered to give up the vessel hired for his own escape, but meanwhile Napoleon had determined to surrender himself into the hands of the English. After a residence of some years at Point Breeze, in New Jersey, United States, where he employed himself in agriculture, and was highly esteemed by his neighbors, Joseph B. came to England in 1832, having previously, on hearing of the July revolution, written a letter to the house of deputies, in which he advocated the claims of his nephew, the late emperor of France, and in 1841 was allowed to return to his wife, who had remained in Italy since 1815. He died in Florence, July 28, 1844. Joseph was the only one of his brothers for whom Napoleon professed to care anything. He was a handsome, intelligent-looking man, distinguished by the elegance of his manners and conversation. His wife, Julie Marie Clary, born Dec. 26, 1777, was the daughter of a wealthy citizen of Marseilles, and the sister-in-law of Bernadotte, king of Sweden. She was a quiet unambitious woman, with no taste for the splendors of royalty, which fell to her share during a few weeks only at Naples, for she never went to Spain. Ill health appears to have prevented her accompanying her husband to America. She died in Florence, April 7, 1845. By her marriage with Joseph B., she had two daughters—1. Zenaide Charlotte Julie, born July 8, 1801, died 1854, who became the wife of Lucien B.'s son, the prince of Canino; 2. Charlotte Napoléone, born Oct. 31, 1802, died Mar. 3, 1839, who married Louis Napoleon, second son of Louis B., king of Holland. Her husband died Mar. 17, 1831.

Bonaparte, Lucien, prince of Canino, and brother of Napoleon, was born at Ajaccio in 1775, and received his education in the college of Autun, the military school at Brienne, and the seminary at Aix. Rising gradually from one office to another, he was elected deputy for the department Liamone, and, in the council of five hundred, spoke against the squandering of state-property, and formed a party favorable to the views of his brother Napoleon. Shortly before the 18th Brumaire, he was elected president of the council of five hundred, and was the hero of that day. During the ferment which followed Napoleon's entrance, Lucien left his seat, mounted his horse, and riding through the ranks of the assembled troops, called upon them to rescue their general from assassins. Afterwards appointed minister of the interior, he was active in the encouragement of education, art, and science, and organized the prefectures. As ambassador to Madrid, 1800, he contrived to gain the confidence of king Charles IV. and his favorite Godoy, thus putting aside the British influence which had until then been exercised at the court of Spain. It is said that for his services in the treaty of peace concluded between Spain and Portugal, Sept. 29, 1801, he received 5,000,000 francs.

His constant opposition to Napoleon's progress towards monarchy involved Lucien in several misunderstandings with his brother; and their quarrel was brought to an issue by Lucien's second marriage against the views of Napoleon. On condition that he would divorce his wife, the crowns of Italy and Spain were offered to Lucien; but he refused them, and preferred living in retirement at his estate of Canino, in the province of Viterbo, near the frontiers of Tuscany, where he devoted his time to art and science. Here he enjoyed the friendship of the pope, who created him prince of Canino and Musignano; but having denounced in his private capacity the arrogant and cruel policy of his brother towards the court of Rome, he was "advised" to leave the city in which he was at that period residing. In 1810, he took ship for America, but fell into the hands of the English; was brought to England; and after a debate in parliament, was declared to be a prisoner, but treated with distinction. After his brother's downfall, he returned to Rome.

After the defeat at Waterloo, Lucien B. alone seems to have preserved his presence of mind. He immediately advised his brother to dissolve the chambers, and assume the place of absolute dictator. After the second ascent of the throne by Louis XVIII., Lucien lived for some time in and near Rome. In 1830, he went to England, visited Germany in 1838, and died at Viterbo, June 30, 1840. Lucien B. possessed considerable talents and firmness of character. He was in his early years a keen republican, but the weakness of the directory convinced him that a military consulship was necessary to allay the social anarchy of France. He consequently threw himself eagerly into the designs of his brother, but protested against Napoleon giving way to his desire for a hereditary monarchy. As a writer, he was by no means successful. His long and tedious epic poem, *Charlemagne ou d'Eglise Délivrée*, in 24 cantos, was written and published in London, and was dedicated to the pope, 1814. Another heroic poem, *La Cyrnéide ou la Corse Sauvée*, followed in 1819. The *Mémoires Secrets sur la Vie Privée Politique et Littéraire de Lucien B.* (2 vols., Lond. 1819), of which Alphonse de Beauchamp is supposed to be the author, is an untrustworthy book. Lucien B. was the father of a numerous family. In 1795, he married Christian Boyer, the daughter of a citizen of St. Maximin. After her death, he married, in 1803, the widow of a stockbroker, Madame Jouberthon, who was his survivor. By his first marriage, he had two daughters—Charlotte, born 1796, died 1865, who married prince Gabrielli of Rome; and Christine, born 1798, died 1847, who married first a Swedish count named Posse, and then lord Dudley-Stuart. By his second marriage, Lucien had nine children: the eldest daughter, Letizia B., born 1804, died 1871; married, in 1824, Mr. (afterwards sir) T. Wyse, an Irish gentleman; but a separation took place in a few years.—The second daughter, Jeanne B., distinguished by her beauty and taste for poetry, was born in

1806, and died soon after her marriage with the marchese Honorati.—The third daughter, Alexandrine Marie B., born in 1818, married, in 1836, count Vincenzo Valentini de Canino, and gave birth to two sons and one daughter.—Constanze, the youngest daughter of Lucien B., was born in 1823.—Charles Lucien Jules Laurent B. (eldest son of Lucien B.), prince of Canino and Musignano, was born at Paris in 1803. He never exhibited any inclination for political life, preferring the more quiet and wholesome pursuits of literature and science. He acquired a considerable reputation as a naturalist, and especially as a writer on ornithology. He died 29th July, 1857. He was a member of the principal academies of Europe and America. His chief publications are a continuation of Wilson's *Ornithology of America*, and the *Iconografia della Fauna Italica*.—The second son, Paul Marie B., born in 1806, took a part in the Greek war of liberation, and died by the accidental discharge of a pistol, 1827.—The third son, Louis Lucien B., born Jan. 4, 1813, has distinguished himself by his studies in chemistry, mineralogy, and languages.—Pierre Napoleon B., the fourth son, born Sept. 12, 1815, passed through many changes of fortune in America, Italy, and Belgium, returning to France after the catastrophe of 1848. In 1871, he shot a journalist, Victor Noir, for which he was tried the same year at Tours, and acquitted of the charge of murder, but condemned to pay £1000 to Victor Noir's relatives.—The youngest son, Antoine B., born Oct. 31, 1816, fled to America after an affair with the papal troops in 1836, and returned to France in 1848, where he was elected into the national assembly, 1849, but retired from politics in 1851.

Bonaparte, Louis, third brother of Napoleon, was b. Sept. 2, 1778, and was educated in the artillery school at Chalons, where he imbibed anti-republican principles. After rising from one honor to another, he was made king of Holland, 1806; but, in fact, he was never more than a French governor of Holland, subordinate to the will of his brother. Amid all the faults which marked his reign, it must be remembered to his advantage that on several occasions he firmly withstood the demands of France; that he replied to one requisition by saying that, since he had been placed on the throne of Holland, he had "become a Dutchman;" that he nobly refused to accept the tendered crown of Spain; and lastly, that he did not enrich himself during his reign. After the restoration of the house of Orange, Louis considered himself free from all responsibility, and returned to Paris, Jan. 1, 1814, where he was coldly received by the emperor. After living for some years in Rome—where he separated from his wife—he removed in 1826 to Florence, where he lived in retirement. On the escape of his son, Louis Napoleon, from the prison of Ham, the ex-king of Holland was removed as an invalid to Livorno, where he died July 15, 1846. Louis B. was the writer of several works: *Marie, ou les Hollandaises*, 1814, a novel, giving some sketches of Dutch manners; *Documents Historiques, etc., sur le Gouvernement de la Hollande* (3 vols., Lond. 1821); *Histoire du Parlement Anglais*, 1820; and a critique on M. de Norvins's *History of Napoleon*. Louis B. was married in 1802 to Hortense Beauharnais, daughter of gen. Beauharnais (q.v.) by his wife Josephine, afterwards empress of the French. As this marriage was wholly a matter of submission to his brother's will, and put aside a former engagement, it naturally ended in unhappiness and separation

The amiable and accomplished Hortense Eugenie Beauharnais, the adopted daughter of Napoleon, queen of Holland, and countess St. Leu, was born in Paris, April 10, 1783. After the execution of her father, she lived for some time in humble circumstances, until Napoleon's marriage with Josephine. In obedience to the plans of her step-father, she rejected her intended husband, gen. Desaix, and married Louis B. in 1802. In 1814 she was the only one of all the *Napoleonida* who remained in Paris. After the hundred days, she visited Augsburg and Italy, and then fixed her residence at Arenenberg, a mansion in the canton Thurgau, where she lived in retirement, sometimes spending a winter in Italy. In 1831, when her two sons had implicated themselves in the Italian insurrection, the countess traveled in search of them through many dangers, and found the elder deceased, and the younger, the late emperor of the French, ill at a place near Ancona. Returning with her son to Paris, she was pleasantly received by Louis Philippe and by Casimir Périer, but was obliged, in the course of a few weeks, to remove with her son to England. After some stay there, she removed to her country-seat, Arenenberg, where she died, after severe suffering, Oct. 3, 1837, and was buried near the remains of her mother, Josephine, at Ruel, near Paris. She was the authoress of *La Reine Hortense en Italie, en France, et en Angleterre, pendant l'année* 1831, and wrote several excellent songs. She likewise composed some deservedly popular airs; among others the well-known *Partant pour la Syrie*, which the late emperor of the French, with a delicate union of political tact and filial pride, made the national air of France. Of her three sons, the eldest, Napoleon Louis Charles, born 1803, died in childhood, Mar. 5, 1807. The second, Louis Napoleon, born 1804, crown-prince of Holland, married his cousin Charlotte, daughter of Joseph B., and died at Forli, Mar. 17, 1831. The third, Charles Louis Napoleon, became emperor of the French. See Louis Napoleon.

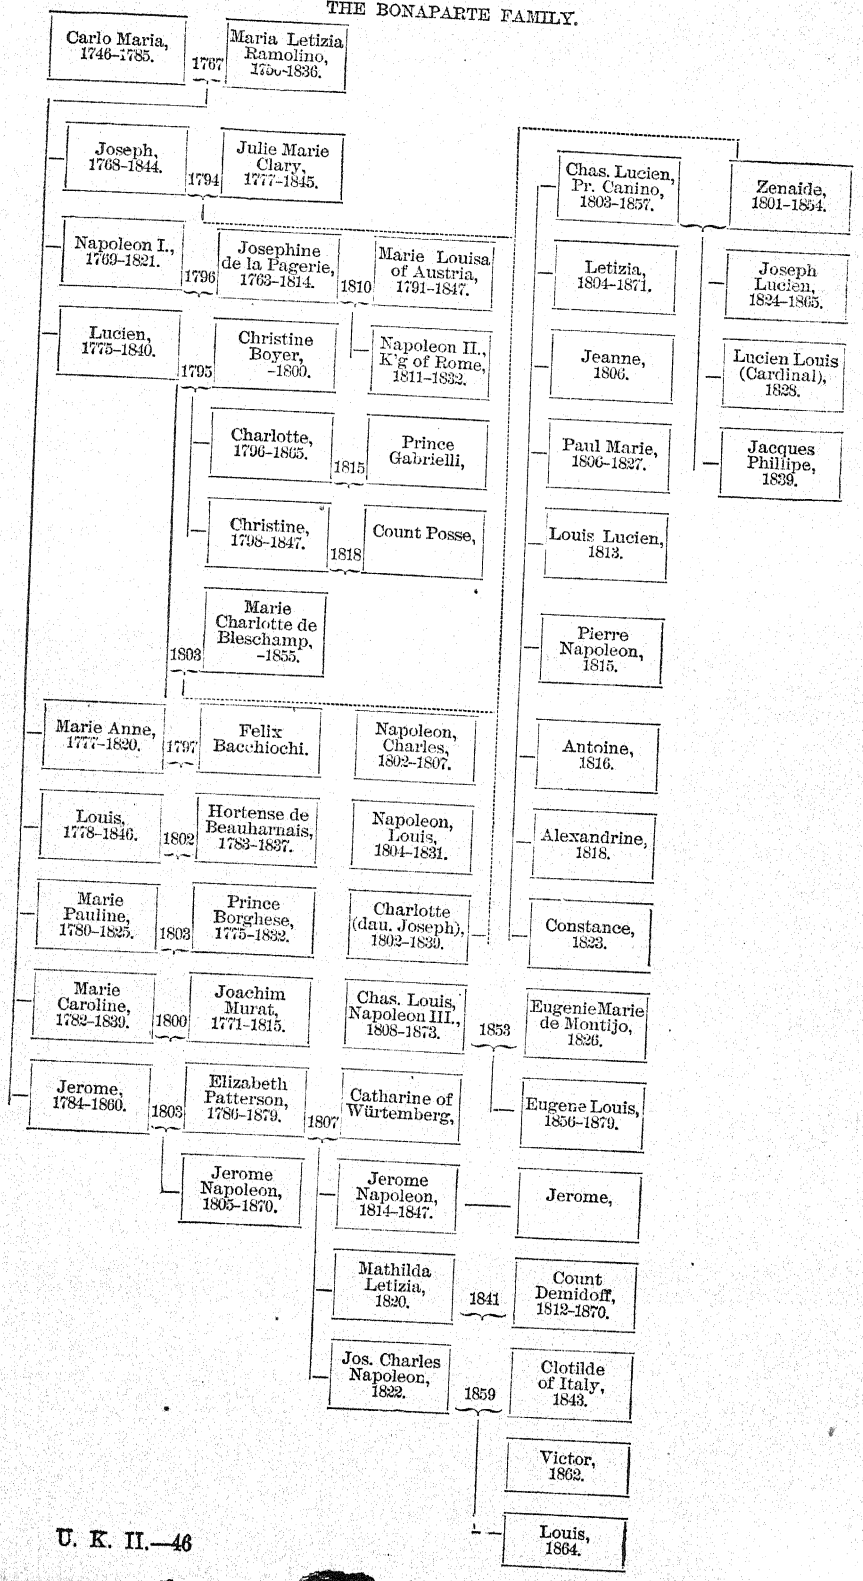
Bonaparte, Jerome, youngest brother of Napoleon, was b. at Ajaccio, Nov. 15, 1784. After receiving his education in the college at Juilly, he served as naval lieut. in the expedition to Hayti. When war broke out between France and England in 1803, Jerome was cruising off the West Indies, but he was soon compelled to take refuge in

the port of New York. While in America, he married Elizabeth Patterson, daughter of a merchant in Baltimore, Dec. 27, 1803. Subsequently, he was employed by Napoleon in the liberation of Genoese prisoners who had been captured by the dey of Algiers. In the war with Prussia, he commanded, in concert with gen. Vandamme, the tenth corps in Silesia, and on the 1st Dec., 1807, was made king of Westphalia. He was recognized with great pomp at Cassel, where he lived in splendor, caring very little for government, not even taking the pains to acquire the vernacular language of the country. After the war with Austria, the finances of Westphalia, through mismanagement, plunder, and extravagance, as well as war-expenditure, were found in an exhausted condition. The battle of Leipsic brought the reign of Jerome to a close. After the peace of 1814, he left France, and resided in Switzerland, at Grätz, and in the beginning of 1815, at Trieste. He was made a peer when Napoleon returned from Elba, and fought by the side of the emperor at Ligny and at Waterloo. After his brother's abdication, he left Paris, June 27, and visited Switzerland and Austria, but ultimately settled in Florence. His request to be allowed to return to France was rejected in 1847, by the chamber of peers, but was afterwards granted, and at the outbreak of the Feb. revolution, Jerome B. was in Paris, where he was appointed governor of the Invalides in 1848, and in 1850 was made a French marshal. He died in 1860.

His marriage with Elizabeth Patterson having been declared null by Napoleon, Jerome was forced, after he had gained the Westphalian crown, to marry Sophia Dorothea, daughter of king Frederick I. of Würtemberg. After the battle of Waterloo, her father wished to annul the marriage; but the wife of Jerome declared her resolution to share through life the fortunes of her husband. Jerome B. left in America one son by his first marriage, and had three children by his second wife.—JEROME B., the elder son, born Aug. 24, 1814, died May 12, 1847; MATHILDE LETITIA WILHELMINE B., princess of Montfort, born at Trieste, May 27, 1820, married the Russian count Anatol Demidov, and lived with her husband at the court of Louis Napoleon during his presidency. The younger son, NAPOLEON JOSEPH CHARLES PAUL B., born at Trieste, Sept. 9, 1822, passed his youth in Italy; entered the military service of Würtemberg, 1837; afterwards traveled in several countries of Europe; and was banished from France, 1845, on account of his intercourse with the republican party. He returned to Paris with his father, 1847, and after February, 1848, was elected into the legislative national assembly. He commanded an infantry division of reserve at the battles of Alma and Inkermann the following year. In 1859, he married the princess Clotilde, by whom he has two sons and a daughter. When war with Prussia was declared in 1870, Prince N. proceeded on a diplomatic mission to his father-in-law, at Florence, but failed to obtain the co-operation of Italy with his cousin. After the fall of the empire he took up his residence in England, but returned to France in 1872.

BONAPARTE (*ante*), also NAPOLEON, *ante*. The following table shows the relationships of this family, whose members have been so prominent in modern Europe:

THE BONAPARTE FAMILY.



Prince Lucien Bonaparte names the following who, 1880, are in order of succession 1. Cardinal Bonaparte. 2. Napoleon Charles, brother of the cardinal. 3. Louis Lucien 4. Pierre Napoleon. 5. Jerome, grandson of Jerome, the youngest brother of Napoleon.

BONA'SIA, a genus of gallinaceous birds of the grouse (q.v.) family or *tetraonidæ,* perhaps more properly only a sub-genus of grouse (*tetrao*), distinguished by having the toes and the lower part of the tarsus (or shank) destitute of feathers; also by the elongated feathers of the upper part of the head. To this genus belongs the hazel grouse of the continent of Europe (*tetrao bonasia* of Linnæus), a species which, although not found in Britain, is very widely distributed from Siberia to Africa, and throughout that continent. In size, it scarcely exceeds the common partridge, is prettily mottled with gray and reddish-brown, and has a black band near the extremity of the lateral tail-feathers. It loves the deepest solitudes of forests. The eggs are 12 to 18 in number. The flesh of this bird is highly prized, and German etiquette has long assigned it a place above all other dishes at the tables of princes, as the only dish which may be served twice in succession.—Another species of B. is the ruffled grouse of America (*B. umbellus,* or *tetrao umbellus*), known also in some parts of the United States by the names of pheasant and partridge. It is nearly equal in size to the black-cock of Europe. Besides having the feathers of the upper part of the head elongated, the male has a large shoulder-tuft on each side. This bird is found in almost all parts of North America, from the gulf of Mexico to Hudson's bay, and from the Atlantic to the Pacific ocean. It is polygamous, and in spring the males make a noise called *drumming,* by rapid clapping of their wings, to attract the attention of the other sex, whilst they also strut with erected ruff and tail, and with wings depressed, after the manner of the turkey-cock. At this time they have fierce battles with one another, and advantage is sometimes taken of their jealous pugnacity to attract them within shot, by an imitation of their drumming, accomplished by means of a bladder and a stick. The nest is formed on the ground in the woods, often under a bush, and 5 to 12 eggs are laid in it. The flesh of the ruffled grouse is much esteemed, and the markets of the American cities and towns are well supplied with it in the winter months.—It seems probable that both these species of B. might be easily introduced into Britain, and they would be very desirable additions to the game of woods and plantations.

BONAS'US, or BONAS'SUS. See BISON.

BONAVENTU'RA, SAINT, one of the most eminent Catholic theologians, whose real name was John of Fidanza, was b. in 1221 at Bagnorea, in Tuscany. In 1248, he became a Franciscan monk; in 1253, a theological teacher at Paris, where he had studied; and in 1256, general of his order, which he governed strictly, but affectionately. The influence of his character now began to penetrate the church; and it was mainly through his eloquent persuasion that the differences which had sprung up among the cardinals on the death of Clement IV. in 1268 were reconciled, and all induced to unite in electing to the papal dignity Tedaldus Visconti (Gregory X.). The new pope created B. bishop of Albano, and cardinal in 1273, when he accompanied Gregory to the council of Lyon, where he died, July 15, 1274, from sheer ascetic exhaustion. He was honored with a splendid funeral, which was attended by the pope, the king, and all the cardinals.

On account of his unspotted character from earliest youth, as well as the miracles ascribed to him, he enjoyed, even during his life-time, especial veneration. Dante, who wrote shortly after, places him among the saints of his Paradiso; in 1482, he was formally canonized by Sixtus IV.; and in 1587, was ranked by Sixtus V. as the sixth of the great doctors of the church. The religious fervor of his style procured for him the title of *doctor seraphicus,* and his own order are as proud of him as the Dominicans are of Thomas Aquinas. A great part of his writings is devoted to the praise of his order, and to the defense of Mariolatry, celibacy, transubstantiation, communion in one kind, and other doctrines and practices of the middle ages, which he attempts to deal with in a philosophical manner. His most important works, the *Breviloquium* and *Centiloquium,* are properly text-books on dogmatics. Unfortunately, his efforts to philosophize the church creed, and that deep mysticism in which his spirit reveled, make him often obscure and unintelligible even in his most popular treatises. With B. theology is the goal of all art and science; and in his *Itinerarium Mentis in Deum,* as also in his *Reductio Artium in Theologiam,* he represents union with God, to which the soul attains through six stages, as the highest good. He did more than any other of the early theologians to give a scientific form to the mystical theology. His *Biblia pauperum,* or "poor man's Bible," is a mystico-allegoric explanation of the plain contents of the sacred books for the benefit of the laity. In warmth of religious feeling, however, and in the practical tendency of his ethics, he far excels the hair-splitting scholastics. In his commentary on the *Sententiæ* of Peter the Lombard, he acutely argued against the eternity of the world, and also advanced some original proofs of the immortality of the soul. The most complete edition of his works appeared at Rome (8 vols. 1588–96).

BONAVENTURE, a co. in the province of Quebec, Canada, on the bay of Chaleurs, separated from New Brunswick by the Mistouche and Ristigouche rivers; 3290 sq.m.; pop. '71, 15,923. Capital, New Carlisle.

BONA VISTA, a bay and cape on the e. coast of Newfoundland, in lat. 48° 42′ n., and long. 53° 8′ west.

BONCHAMP, CHARLES MELCHIOR ARTHUR, Marquis de, one of the bravest leaders of the Vendean party in the civil war consequent upon the French revolution, was born at Jouverdeil, in the old province of Anjou, May 10, 1760; took part, like many young French officers, in the American war of liberation; and when he returned to France, was made captain. Of strong royalist principles, he looked with disfavor on the revolution. After living for some 18 months in solitude, he allowed himself to be chosen leader of the Anjou insurgents. The army of La Vendée would have been more formidable if B.'s tactics had been adopted, but this was not done until it was too late. In the sanguinary encounter at Chollet, Oct. 17, 1793, B. received a fatal shot in the breast, and when his followers vowed to avenge his death on 5000 republican prisoners, the dying hero exclaimed: "Spare your prisoners. I command it." This last command was obeyed.

BOND, in masonry, is the connection established among the stones or bricks in a wall, by disposing them so as to overlap one another. See BRICKLAYING.

BOND, in law, is an instrument on stamped paper, by which the party granting it becomes bound to pay a sum of money, or perform any act or duty, according to the terms of agreement. In England, a B. is said to be an instrument under seal, whereby one person becomes bound to another for the payment of a sum of money, or for the performance of any other act or thing. The person who is thus bound is called the obligor, and he to whom the B. is given, the obligee; and this obligation may be either by or to one or several persons. The B. may be unconditional simply for the payment of money, or it may be accompanied with a condition, the performance of which is secured by a penalty; but in any event, the debt created by a B. is of the high nature of a *specialty debt* (q. v.).

The requisites of a good B. are as follow: 1. The B. must have an obligor and obligee. In regard to such parties, it is to be observed that in general no person who is under any legal disability to contract, can become an obligor, though it is otherwise of an obligee. Thus, B. by a married woman neither binds herself nor her husband, but is absolutely void. This is a rule, however, which is liable to some qualifications. See HUSBAND AND WIFE. Nor can an infant bind himself, unless the B. be for necessaries. But although a married woman is incapable of executing a B., yet one given to her is valid, and the interest in it will vest in her husband, without whose concurrence in its acceptance indeed the B. will lose its force. In the same way, a B. may be given to an infant, a lunatic, or an alien. 2. The next requisite of a B. is, that it must state the precise sum in which the obligor is bound; any omission in this respect will invalidate the instrument. If, however, the sum be merely erroneously stated, the courts will make the necessary correction, and construe the B. so as to give effect to the intention of the parties. In practice, the sum stated is generally double the sum intended to be secured —the excess being meant to cover the interest and any costs. 3. A B. must be so expressed as to create a clear legal obligation. But for this purpose no particular form of words is necessary; any mode of expression by which the intention appears will suffice. A B., again, may be in the first or third person, only it must be expressed in the English language, and not in Latin or French. 4. The B. must be duly executed. Such execution, in general, is the same as that of deeds, the sealing being the essential solemnity; and although it is usual for the obligor to sign the B., his signature is not necessary to its validity. Then the B. must be delivered, but it need not be dated; a B. has even been held good, though it bear a false or impossible date, on the principle that deeds take effect from, and have relation to, the time of their delivery, and not in reference to their date. Such, in general, is the form and structure of an English B., and it is used in an infinite variety of contracts.

In Scotland, the B.—personal B., as it is called—differs in several points of form from the English instrument. Its general structure is different, and it is executed in a different manner, with much solemnity and particularity, but without sealing; it does not bear to be for double the sum due, or any sum other than the correct one, which it states with precision, with a liquidate penalty, which is usually one fifth of the principal sum; and it must have a *true* date and be very specific in all its details. As in English practice, there are in Scotland two kinds of these instruments: first, bonds for money simply; and secondly, bonds for the performance and accomplishment of some act, or, as they are called in Scotch practice, bonds *ad facta prestanda*.

A mortgage over land or other real estate is also in Scotland in the form of a B., by which name, indeed, the mortgage is technically described. Thus, there is the *heritable B.*, and the *B. and disposition in security*, the latter being the more modern form. By these mortgage bonds, the borrower not only becomes personally bound in the repayment of the loan, but "in further security and more sure payment" he also conveys to the lender the land, or other real property, itself, on which the sum is to be made a charge, with, in a certain event and under certain conditions, a power of sale, by means of which the creditor, on the debtor's default, may recover his money. There are, in England, bonds by which expectant heirs may operate on their reversions, and these are called *post obit bonds*.

According to the law of both countries, certain bonds are void; such as a B. conditioned either to do something which the law considers wrong in itself, or which is legally prohibited, or to omit doing something which is a duty, or to encourage the performance of anything which is in the nature of a crime or offense against the law. In like manner, bonds to procure marriage, called marriage brocage bonds, or to restrain marriage, or for immoral considerations, or in restraint of trade, are void. A B., however, may be valid in part, or void in part, if such parts are separable. See MORTGAGE, BROCAGE BONDS TO PROCURE MARRIAGE, SPECIALTY DEBT.

BOND, in law (*ante*), is simple or conditional, the latter being generally used. It must be in writing, and signed, and should be sealed. The condition is the vital part, limiting and determining the amount to be paid or the thing to be done, and no person can take the benefit of a B. except the parties named therein, save in the case of a B. given by an officer for the performance of duty. If a B. runs to several persons jointly, all must join in suit for breach, although the conditions may not at all affect some of them. Recovery against a surety on a B. is not limited to the penalty, but may go beyond as far as necessary to include interest from the time of default. A B. dormant for 20 years cannot afterwards be recovered, the presumption being that it has been satisfied. If the maker of a B. binds himself without adding "heirs," the heirs cannot be held, but the executors and administrators are liable.

BOND, a co. in s.w. Illinois, intersected by the St. Louis, Vandalia, and Terre Haute railroad; 400 sq.m.; pop. '70, 13,552, in '80, 14,873. It is a prairie and woodland region, with fertile soil, producing cereals, and having coal mines. Co. seat, Greenville.

BOND, GEORGE PHILLIPS, 1825–65; son of William Cranch, and his assistant in the observatory, succeeding to full charge on his father's death. He published a *Treatise on the Construction of the Rings of Saturn*, and *Elements of the Orbits of Hyperion and the Satellite of Neptune*. That satellite and the 8th of Saturn were discovered by his father and himself. For a work on Donati's comet the royal astronomical society sent him a gold medal.

BOND, THOMAS EMERSON, D.D., 1782–1856; a physician, editor, and minister, b. in Baltimore; professor in Maryland university, and local preacher of the Methodist church. In 1830, he was editor of the *Itinerant*, and in later years for a long time of the *Christian Advocate and Journal*, the leading newspaper of that church. Among his works are *Appeal to the Methodists*, and *Narrative and Defense*.

BOND, WILLIAM CRANCH, 1789–1859; b. Maine; an eminent astronomer. He was self-educated, and had a private observatory at Dorchester, where his discoveries attracted much attention. In 1838, he was chosen by the U. S. government to make observations for the use of the Wilkes's exploring expedition. In 1839, he supervised the construction of the observatory at Harvard, and became its director. He was the inventor of a method of measuring time to a very small fraction of a second, and among the first to employ photography in stellar observations. He was a member of the academy of arts and sciences, and of the philosophical and royal astronomical societies of London.

BOND'AGER, the term applied in Scotland to a rural laborer who rents a cottage from a farmer under an obligation to work for him at current wages at certain seasons. There are male and female bondagers, but the arrangement in each case is the same. The origin of the bondager system is the want of a sufficient rural population for the field-work of the neighborhood. To induce the settlement of laborers, a landlord gives a certain number of cottages along with each farm, and the tenant-farmer has the privilege of letting these, with a view to securing casual assistants, such as at turnip-hoeing and harvest. When wanted, they are obliged to turn out though it may be at a sacrifice in point of wages or feeling. Such are bondagers, a class of cottagers over whom the landlord has no direct control; and as the farmer for the most part looks alone to their physical capacity, their moral and social condition is not generally creditable.

BOND CRED'ITOR, in England, is the name sometimes given to a creditor whose debt is secured by a bond, and therefore privileged as a specialty. See preceding article.

BONDED WAREHOUSE. See WAREHOUSING SYSTEM.

BÖNDER, in Norway and Sweden, the landowners or farmers. Under the ancient kings of Norway they were a powerful class, and often compelled important concessions from their rulers, or deposed them. They would nearly correspond to burgesses and barons in England.

BONDI, CLEMENTE, a modern Italian poet, b. in 1742 at Mizzano, in Parma. He was educated by the Jesuits; and when still very young, appointed to deliver lectures in rhetoric, in the royal convent at Parma. Here he produced his first work, *Giornata Villereccia* (Parma, 1773), which is a not very lively picture of the rural pleasures of the brotherhood. Having celebrated in verse the abolition of the Jesuit order, he was subjected to a priestly persecution, and compelled to conceal himself in the mountains

of the Tyrol; but ultimately he found a patron in the Austrian Archduke Ferdinand. He fixed his residence in Vienna, where he died in 1821. His poems are lyrical, descriptive, satirical, and elegiac. They please cultivated men, but more especially women of delicate sensibilities, by the light-flowing elegance of their versification, and the rare purity of their style. Among his larger works may be mentioned, *La Conversazione*, *La Felicità*, and *Il Governo Pacifico*. Italians consider B.'s translation of the *Æneid* to possess remarkable excellence. His entire works were published at Vienna in 1808.

BONDOU', or BONDU, a country of Senegambia, w. Africa, lying between lat. 14° to 15° n., and long. 11° to 13° west. The population is estimated at 1,500,000, who are principally engaged in the cultivation of the soil, which is fertile, producing cotton, indigo, millet, maize, tobacco, etc. The weaving of cotton-cloth, which, besides being made up into articles of dress, is used as currency, also forms part of the industry of the people. The surface of B. is level, with elevations in the north and central parts; the climate generally healthy, and vegetation luxuriant alike in field and forest. Iron is said to be plentiful, though not much worked, and gold is obtained in small quantity. Wild animals are numerous; and the principal river on the eastern border of the country, the Falemé, abounds with crocodiles. The inhabitants of B. profess Mohammedanism, but they trust greatly in sorcerers. The sovereign is absolute. B. exports cattle, corn, and gums; and has a transit trade in slaves, gold-dust, iron, salt, and butter. The capital, Bulibani, is situated in a plain bounded by rocky hills and forests on the left bank of the Falemé. Its streets are unpaved and dirty, and its buildings mean and miserable; mud-walls surround it, and in its center is the extensive but rude palace of the sovereign. Pop. about 2200, composed in great part of slaves, from the sale of which the ruler derives a considerable revenue.

BONE is the hard material of the skeletons or frameworks of mammalian animals, reptiles, and birds. In its earliest stages, it is termed temporary cartilage (q.v.), and consists of cells massed together, except in the flat bones, as those of the skull and shoulder-blade, of which the primary foundations are to a great extent of fibrous tissue. Points or centers of ossification form, the cells alter their form and arrangement, and a deposit of earthy materials, phosphate and carbonate of lime, takes place, rendering the former flexible substance rigid. By soaking a B. in a dilute mineral acid, we can dissolve these earthy matters, and render it again flexible; on the other hand, if we expose it to intense heat, the animal matter (gelatine) is got rid of, and though the bone retains at first its form, the slightest touch will cause its now unsupported earthy matter to crumble away. We see, in the ill-nourished children of large towns, too many examples of how necessary a proper relation of these two elements of B. to each other is; in the disease called rickets, the earthy matter is deficient, and the too flexible leg-bones bend under the weight of the trunk. In the aged person, again, the B. substance becomes more densely packed with earthy matter, and becomes brittle, rendering them peculiarly liable to fractures.

The bones of the skeleton are classified according to their shapes—viz., as long bones, e.g., the thigh-bone and arm-bone; flat bones, as the shoulder-blade and skull-bones; short and irregular bones, as those of the wrist or vertebræ. The substance of bones is arranged differently in different parts—either hard and close, which is called the condensed substance, or loose and reticulated, called the cancellated structure. *Long bones* have a shaft of hard substance terminating at each end in soft or cancellated structure; in the latter situations, the B. is more expanded and rounded off to enter into the formation of a joint. *Irregular bones* consist of a shell of condensed tissue, inclosing a mass of cancellated structure, and are smoothed off into surfaces adapted to those of the adjoining bones. *Flat bones* consist of two layers of hard tissue, with an intermediate cancellated structure. Anatomists also talk of *mixed* bones, those which are both long and flat, as the ribs, the breast-bone, and the lower jaw.

The shaft of a long B. is hollow, and filled with an oily substance, the marrow (q.v.); the space in which the marrow lies is called the medullary canal. This fatty substance is also found in the cancellated structure of short and mixed, and in the diploë of flat bones, and even in the condensed tissue. Bones are covered externally by periosteum (q.v.), and on the surfaces of the cavities within by a fine membrane called internal periosteum or medullary membrane. B. is largely supplied with blood-vessels, which are continued into it from those of the periosteum; the largest are those which enter the cancellated ends of the long bones. The medullary membrane receives a special artery for the supply of the compact tissue next the canal. This vessel enters the bone generally rather above its middle, and divides into two branches, one of which runs up, the other downwards, both dividing into numerous branches, anastomosing with the vessels we have alluded to as entering the cancellated tissue. After the arteries enter the compact tissue of bones, they run in small capillary canals, invisible to the naked eye, which permeate the bone, and anastomose, leaving oblong loops or meshes. The veins of B. are also contained in these canals, but they are larger than the arteries, and possess at irregular intervals, where branches meet, dilatations or reservoirs for the blood.

These canals, named Haversian, after their discoverer, Clopton Havers, an old English anatomist, vary in diameter from $\frac{1}{250}$ to $\frac{1}{200}$ of an in. They take a longitudinal direction, and if a transverse section is examined under the microscope, it appears

pierced with holes, which are the Haversian canals cut across. Each canal is surrounded by its own layers of condensed structure, forming in the aggregate a hollow rod or pin, called the Haversian system, running through the plates of which the B. is composed, and securing their cohesion. In addition to these, there are to be seen a number of minute spaces or *lacunæ*, generally oval in man; from these pass numerous pores or *canaliculi*, which are directed to the nearest vessels: those in the periosteal, or outer lamella, pass into the B. from orifices on its surface, and the lacunæ face outwards. The pores of the internal layer open on the medullary canal, and its lacunæ face towards it, and the lacunæ in the layers around each Haversian canal face towards, and their pores open into it.

Nerves may be seen entering B., and the acute pain felt in some of its diseased conditions prove their existence, but they have not yet been actually demonstrated in the osseous tissue; neither have *absorbents*, though we suppose from analogy that bones are supplied with them.

The several bones composing the animal frame will be treated of under the head Skeleton. Any important peculiarities in the bones of different classes of animals, under the heads of these classes.

Chemical Composition of Bone.—The principal chemical ingredients present in B. are gelatine and phosphate of lime; and the following table represents the composition in 100 parts of B. of average quality:

	Human bones.	Ox bones.
Gelatine	33.30	33.30
Phosphate of lime	53.04	57.35
Carbonate of lime	11.30	3.85
Phosphate of magnesia	1.16	2.05
Soda and chloride of sodium (common salt)	1.20	3.45
	100.00	100.00

When a B. is digested in dilute hydrochloric acid at a summer heat, the earthy matters are gradually dissolved out, leaving the gelatine of the size and shape of the original B., but now soft, somewhat transparent, flexible, and even elastic. If this soft gelatinous residue of B. be boiled with water, it dissolves in great part therein, and yields a solution which *sets* or gelatinizes on cooling. A more common way of extracting the gelatine from B. is to heat the bones covered with water in a digester to a temperature of 270° to 280° F., when much of the gelatine dissolves out, and leaves the earthy salts with the remainder of the gelatine. Besides the marrow (q.v.), a little fat is generally found permeating the entire structure of the B., which can be extracted by throwing the bones into hot water, when the grease or fat exudes and floats to the surface. In some of the larger bones of man and other mammalia, there is a central cavity containing a considerable amount of fatty matter, popularly known as *marrow*. These cavities are not found in the bones of the young animal, but gradually form as the animal approaches maturity. In the sloth, cetacea, seals, and a few other animals, the cavities are not found. Occasionally, as in man, the elephant, giraffe, etc., the bones in the head have cavities filled with air instead of marrow. The uses to which a B. may be put are various. In the cooking of soups, bones form a constant ingredient, and become useful in supplying gelatine, which gives a *body* to the soup it would not otherwise possess. Where the soup is required of great lightness, for an invalid with weak digestive powers, the shavings of stag's horns may be employed, and these yield a *hartshorn jelly* free from oil, and which therefore sits lightly upon the stomach. How far gelatine is of itself nutritious, is a disputed question. See Gelatine and Nutrition. Animals, however, like the dog, which masticate, devour, and digest the entire B., do derive benefit therefrom, in part from the gelatine, and in other part from the earthy substances; and the same remark applies to the use sometimes made of small fish, where, after being thoroughly browned, they are entirely eaten. In times of scarcity in Norway and Sweden, the poorer people even eat the bones of mackerel and other fish.

B. is largely used in making the handles of small brushes, the more common table-knives and forks, and penknives, and in the manufacture of the cheaper sorts of combs (q.v.). Our forefathers, before the metals were known, fashioned fish-hooks out of B., and used the spines in the tail and back-fin of certain fishes for pointing arrows. These uses of B., coupled with the employment of the serrated teeth of sharks as a war-weapon, are still practiced by many uncivilized tribes. The fatty and other organic matters in B. allow of its being employed as a fuel where coal or wood cannot be obtained, as in the pampas of South America and the steppes of Tartary. In these regions, it is considered that the heat evolved during the combustion of the bones of an ox suffices to cook the flesh.

B. is likewise serviceable in the arts in yielding bone-ash (q.v.), bone-black (q.v.), bone-dust (q.v.), dissolved bones (see Bones, Dissolved), phosphorus (q.v.), and superphosphates; also certain oils and fats (see Dippel's Animal Oil), which are employed in forming lampblack (q.v.), and in the manufacture of soap (q.v.). See also Bones as Manure.

BONE, HENRY, R.A., a celebrated enamel-painter, was b. at Truro, in Cornwall, in 1755. Apprenticed to a china-manufacturer in Bristol, he removed from thence to London in 1779, where he was employed in enamel-painting for lockets, brooches, etc. An enamel-portrait of his wife, exhibited at the royal academy in 1780, first attracted public attention; and he soon obtained a position which rendered it no longer necessary for him to continue his drudgery for the jewelers. In 1800, he was appointed enamel-painter to the prince of Wales, a position which he retained when the prince became king; and he also stood in a similar relationship to George III. and William IV. The royal academy made him an associate in 1801, and a full academician ten years later. Between this time and 1831, when advancing years compelled him to desist from his labors, he produced a large series of works remarkable alike for their beauty and dimensions; in the latter quality they were unapproached by any former or contemporary artist, and the principal of which are "Bacchus and Ariadne," after Titian, which was sold for 2200 guineas, and is now in the national gallery; the "Death of Dido;" "Hope Nursing Love," after Sir Joshua Reynolds; "Venus," etc. He also executed a large number of historical portraits of great merit; and altogether his name is one of the highest, if not the highest in his profession. He died Dec., 1834.

BONE-ASH, or BONE-EARTH, is obtained by the complete combustion of bones in an open furnace, when the oxygen of the air burns away the organic matter or gelatine, and leaves the earthy constituents as a white friable mass, the size of the original bone, but readily reducible to the condition of coarse powder, which is bone-ash. A very large quantity of bone-ash is exported from South America to other countries, especially Britain. The used-up bone-black of the sugar-refiner is also employed as a source of bone-ash, by being heated in a furnace exposed to the air. Bone-ash of good quality contains about 80 per cent of phosphate of lime, and 20 per cent of carbonate of lime, phosphate of magnesia, soda, and chloride of sodium (common salt); but it is occasionally found mixed with sand, especially that procured from South America. Bone-ash is employed to some extent as a source of phosphorus (q.v.), and in the making of cupels (q.v.) for the process of assaying (q.v.); but the most extensive use is in the manufacture of artificial manures, such as dissolved bones (q.v.) and superphosphates.

BONE-BLACK, ANIMAL CHARCOAL, or IVORY-BLACK, is prepared from bones by heating them in close retorts till they undergo the process of destructive distillation, when combustible gases and water, together with the vapors of various salts of ammonia, and oil, are given off, and bone-black is left in the retort. It is generally reduced to coarse grains from about the size of small peas, down to large pinheads, and is extensively used in the arts for decolorizing liquids, such as the syrup of sugar, and solutions of argol (impure cream of tartar), and of the alkaloids, as also in filters (q.v.), for separating chemical impurities from water. The general mode of using the bone-black is to allow the colored liquid to percolate through a layer of the charcoal, when all color is arrested, and the syrup or water runs clear and colorless from under the stratum of charcoal. This power of absorbing coloring matters is also observable in vegetable (peat or wood) charcoal, but not to such an extent as in bone-black. The application of heat to the liquids before filtration greatly facilitates the decolorization, and where the volume of liquid to be operated upon is not great, the most expeditious method is to boil the liquid and bone-black together, and then strain through filtering-paper or cloth. The composition of bone-black in 100 parts is 10 of pure charcoal, associated with 90 of earthy salts —that is, in the proportion of 1 of pure charcoal in 10 of the commercial bone-black. The power of absorbing colors appears to be due to the porosity of the substance, and is not resident simply in the pure charcoal; indeed, the earthy matters (principally phosphate of lime and carbonate of lime) can be dissolved out of the bone-black by dilute hydrochloric acid, and the pure charcoal thus obtained only possesses about one third the decolorizing power of the total amount of bone-black it was obtained from. Thus, if 100 parts of ordinary bone-black have the power of arresting the color from *ten* volumes of a given colored liquid, then the 10 parts of pure charcoal which can be obtained from the 100 parts of bone-black will be found to decolorize only *three* volumes of the same colored liquid; so that it is apparent the earthy matters in the bone-black influence and increase the absorption of the coloring matter, and thus render a given weight of the charcoal of greater commercial value. When syrup of sugar and other liquids have been run through bone-black for some time, the pores of the latter appear to get clogged with the color, and the clarifying influence ceases, and then the bone-black requires to undergo the process of *revirification*, which consists in reheating it carefully in ovens, or iron pipes inclosed in a furnace, when the absorbed color is charred, and the bone-black can be of service once again as an arrester of color. After several reburnings, the bone-black becomes of very inferior absorptive quality, and is then disposed of for the manufacture of bone-ash and dissolved bones (q.v.). Bone-black has likewise a great power of absorbing odors, especially those of a disagreeable nature, and can thus be employed to deodorize apartments, clothing, outhouses, etc., or wherever animal matter may be passing into a state of active putrefaction.

BONE CAVES, natural excavations containing bones of extinct animals. In England there is one at Kirksdale, in Yorkshire, and one at Bristol; in France there are several in the valley of the Dordogne; there is one at Gailenreuth in Bavaria; and others

are in Belgium and Sicily. They are found also in the United States, Mexico, and Brazil. The bones most commonly found are those of the mammoth, rhinoceros, bear, hyena, and lion, and many of herbivorous animals. The caves in England were frequented by hyenas, those on the continent chiefly by bears. In the caves in southern France there have been discovered relics of man and his tools of the stone age, a fact that is thought to point to a high antiquity for the race, as the accompanying bones of animals were not of those domesticated or subjugated by him.

BONE-DUST is obtained by reducing bones to a fine state of division, either under heavy revolving wheels, or by passing them through toothed iron rollers. In order to facilitate the pulverization of the bone, it is occasionally first subjected to the action of hot water and steam in a digester at a temperature of 270° to 280° F., which dissolves out two thirds of the gelatine, and leaves a very friable mass, which can be reduced to powder even when pressed between the fingers. Bone-dust is used in agriculture as a fertilizing agent, either in its ordinary insoluble condition, when the beneficial effects on the land are prolonged over a series of years, or as dissolved bones (q.v.), when the fertilizing force is exerted principally the first year. See BONES AS MANURE.

BONE GELATINE. See GELATINE.

BONER, ULRICH, one of the oldest German fabulists, was a preaching friar of Bern, and is frequently mentioned in documents of the years 1324–1349. He flourished just when the minnesingers and poets of chivalry had passed away. His collection of 100 fables, or "examples," as they used to be called, was entitled *Der Edelstein* (The Precious Stone), and was first printed at Bamberg, 1461. It is marked by purity of style, and by clear and vivid delineation. This book is one of the greatest of all bibliographical rarities, for, at present, only one copy—that in the Wolfenbüttel library—is known. It is decorated with woodcuts. Bodmer and Breitinger published a complete edition of the work at Zürich, in 1757.

BONES, DISSOLVED, a manure prepared by acting upon bone-dust by sulphuric acid of specific gravity 1600. About 15 cwt. of sulphuric acid (of specific gravity 1660) is added to every ton of bone-dust in a mixing vessel, where the whole can be thoroughly incorporated together. The resulting mass is allowed to lie in a heap for several months, during which time it dries up, and when sent into market, is a dark-colored, coarse, soft powder. The original bone-dust contains a large percentage of insoluble or tribasic phosphate of lime (CaO,CaO,CaO,PO_5); and two equivalents of sulphuric acid (HO,SO_3) acting thereon, abstract two of the atoms of lime, and form two equivalents of sulphate of lime (CaO,SO_3), and one atom of the acid phosphate of lime (HO,HO,CaO,PO_5), which are soluble in water. As the gelatine of the B. hinders the sulphuric acid from acting fully on the earthy matter, it is customary to use a good proportion of bone-ash along with the bone-dust, and the absence of gelatine in the former admits of the acid doing its proper work. Very often, bone-ash is alone used in the preparation of dissolved B., and then the manufactured material, containing no gelatine or animal matter, receives the name of *superphosphate of lime*, or simply, *superphosphate*. In place of bone-ash, much bony matter or phosphate of lime, in the form of Apatite (q.v.) and Coprolites (q.v.), is now employed in part in the manufacture of some varieties of dissolved bones. The present value of dissolved B. ranges from £6 to £8 per ton, according to quality; and they contain from 20 to 35 per cent of soluble phosphate of lime, and 15 to 3 per cent of undissolved or insoluble phosphates. This material is very largely employed as a manure in Britain, and is eminently suitable for the cultivation of the root-crops, such as turnips, mangel-wurzel, etc.; and, associated with 12 to 20 per cent of sulphate of ammonia (q.v.), or nitrate of soda, it rivals Peruvian guano in its fertilizing effects on land where cereals—wheat, barley, oats, etc.—are growing.

BONES AS MANURE. The employment of bones as a manure is one of the greatest modern improvements in agriculture. They are applied either simply reduced to small fragments or a coarse powder called *bone dust* (q.v.), or, after undergoing chemical preparations of various kinds, as the basis of highly valuable artificial manures.—See BONE-ASH, and BONES, DISSOLVED.—All the substances which enter into the composition of bones are desirable additions to the soil, but particularly the phosphates. Phosphoric acid, usually found in combination with magnesia, and more particularly lime, enters into the structure of every plant and animal; it is a substance, therefore, which cannot be dispensed with either in the vegetable or animal economy. Being very sparingly diffused through most soils, it is often essential to add it artificially. The productiveness in many districts of Britain had become much impaired by the diminution of phosphoric acid in the soil, owing to the quantity taken off in corn, cheese, and the B. of animals, which were annually raised and exported. The fine red sandstone loams of Cheshire were comparatively sterile in the end of the last century, which was entirely owing to the deficiency of phosphoric acid in the soil, no doubt partly to be attributed to the quantity yearly abstracted by the dairy produce sent to market. So much was this the case, that a liberal dressing of common or calcined B. had the effect of at once doubling the value of the worn-out pastures. In other parts of Britain, however, such as the clay-soils of Suffolk—which at one time were under dairy-farms—the soil is rich in phosphates, and the application of B. as a manure is there attended with little effect.

It becomes, therefore, of practical importance to ascertain when this substance should be added, and when it is not necessary to do so. It is important to observe, that although phosphoric acid is as essential to one crop as to another, yet some crops, such as turnips, require a far more liberal *artificial* supply of it than others, or wheat, which actually require as much to build up their structure. We will shortly state the principles which should regulate the practice of bone-manuring.

All perennial plants, such as grasses, are enabled to extract phosphoric acid from the soil more readily than annual plants, owing to their numerous and well-developed roots, which are ready, even at the beginning of the growing season, to draw supplies from a large mass of soil. Grasses, therefore, are only benefited by phosphoric manures when the soil is more than usually deficient in phosphates. If grass-lands are sterile, it is easy to ascertain if a deficiency of phosphoric acid is the cause, by adding calcined or crushed B., and watching their effect. An experiment of this sort is a much better guide than any analysis of the soil. In Cheshire, the quantity of B. applied to the pastures is from half a ton to a ton per acre; and this dressing will last from 16 to 25 years.

Wheat, also, from the long time it occupies the ground before it is ready to be reaped, and its slow growth during its early stages, can thrive with a small supply of phosphates. These substances are, therefore, comparatively seldom applied directly as a manure for this crop. So, also, with early-sown oats or barley. When these latter crops, however, are late sown, and the rapidly growing conditions of heat and moisture exist, phosphates are often applied with great benefit.

It is as an application to the turnip that phosphoric acid is so marked in its effects, even when the soil already contains it in considerable quantity. The reason of this is not difficult to trace. The seed of the turnip is small, and it is sown at the warm season, when the growth is rapid. The seeds themselves have only a limited quantity of phosphates stored up for the benefit of the roots and leaves of the young plants. Unless the roots, therefore, while yet short, meet with a concentrated supply, the other elements of the food of the plant—carbonic acid, water, and ammonia—however abundantly they may be present, cannot be assimilated, and its growth is arrested. Besides, a liberal supply of phosphates has the effect of pushing on the turnip through its early stages, when it is so liable to injury from various insects.

The effects of B. as a manure for the turnip are greatly increased by dissolving them in sulphuric acid, and manufacturing the soluble superphosphate of lime. Liebig suggested such a use of sulphuric acid in 1839, and since then, hundreds of manufactories of this manure have arisen over the land. The utility of the discovery, however, is not at present so great as is sometimes represented, owing to the large supply of phosphatic guanos now in the market. In these the phosphate of lime is in a finely divided state, and is readily enough taken up by plants without being dissolved by acids. No doubt, as the scarcity of guano begins to be experienced, and its price rises, it will again become a much greater object than at present to manufacture superphosphate from mineral phosphates or bones. Three to four cwts. of dissolved B. or of phosphatic guano is the quantity usually applied to an acre of turnips.

The value of B. as a manure has been long known in some parts of England, but their use was merely local, until more than two decades of the 19th c. had passed; and they were merely broken by a hammer, or rudely or imperfectly crushed by being laid in ruts where cart-wheels might pass over them. The first machines for bone-crushing were employed in Yorkshire and Lincolnshire in 1814 or 1815, and reduced them only to pieces about the size of a walnut, much larger than the coarsest or "rough" bone-dust now in use. The employment of this manure did not become general in Scotland till about 1830, although it had been introduced in East Lothian some years before. Its use has now extended to different parts of the continent of Europe and to North America.

BONESET, or THOROUGHWORT, *eupatorium perfoliatum*, a perennial herb growing in moist soil, much used in the country as a tonic. It has a strong bitter taste, and is taken in the form of hot tea to produce perspiration. If very strong it operates as an emetic. To make B. tea, steep an ounce of dried leaves in a pint of water; let it stand two hours, and strain. It is often used as a substitute for quinine in agues and light fevers.

BONET, JOHN PAUL, a Spaniard of the 17th c., one of the first instructors of deaf mutes. Only one person before him had been at all successful in the art, and about him, B. does not appear to have known anything, so that he is really entitled to the claim of originality in his method, which consisted in imparting instruction by the sight instead of by the ear—gestures, writing, a manual alphabet, and an artificial pronunciation, being the means employed. His plan is minutely detailed in a volume published by him at Madrid in 1620, entitled *Reduccion de las Lettras, y Arte para enseñar a hablar los Mudos*. The manual alphabet now in use at almost all deaf and dumb institutions in Europe and America, differs little from that introduced by Bonet.

BONFIRE, a fire kindled for some purpose of public rejoicing, usually in an open conspicuous place, as the top of a hill, or the center of a village-green. The burning materials consist of tar-barrels, coal, and other combustibles. The practice of kindling

fires of this kind is of so great antiquity in England, Ireland, and Scotland, as to be traced to pagan rites. See BELTEIN. It was customary to kindle one of these fires in token of rejoicing on midsummer eve—the evening before the 24th of June, which day was appropriated by the church for the feast of St. John the Baptist. Reference is made to bonfires on this occasion by George in his translation of the poet Naogeorgus:

> Then doth the joyfull feast of John the Baptist take his turne.
> When bonfires great, with loftie flame, in everie towne doe burne;
> And young men round about with maides doe dance in everie streete,
> With garlands wrought of motherwort, or else with vervain sweete, etc.

For much antiquarian lore on this subject, see Brand's *Popular Antiquities*, edited by sir Henry Ellis, vol. i. The origin of the word B. has been very puzzling to etymologists. In Scotland, the popular term is *banefire* or *bainfire*, which Jamieson says is apparently a corruption of bailfire, which may be doubted. The most probable etymology is the Welsh *ban*, high, whence *ban-ffagl*, a lofty blaze, a bonfire. The same hills that in English are called *beacons*, are in Welsh called *bans* or *vans*. In Danish, also, *baun* is a beacon, and may be traced in such names as *Banbury*.

BON'GAR, *Bungarus* or *pseudoboa*, a genus of venomous serpents, allied to the genera *elaps* and *naja*, and distinguished by a much keeled back, which has a row of hexagonal scales larger than the rest. The head is broad and depressed, with very strong bones. The species, which appear to be few—only two being certainly known—are natives of the East Indies. They are called rock snakes in India. *B. annularis*, which has the body surrounded with rings of black and yellow, attains a length of six or eight feet.

BONGARDIA, a genus of herbaceous plants of the natural order *berberideæ* (q.v.), natives of the east. One species (*B. rauwolfii*) produces tubers, which are eaten, either boiled or roasted, in Persia; and the leaves of another (*B. chrysogonum*) have an acid taste, and are eaten as a salad.

BONGAY', an island of the East Indian archipelago, to the east of Celebes. It gives name to a group of islets, which supplies the neighborhood with slaves and wood.

BONGO, a people of central Africa in the region between 6° and 8° n., and 27° and 29° e., on the tributaries of the White Nile. They are a short-headed race, of medium height, reddish-brown complexion, and black hair. They subsist on sorghum, which they cultivate, fruits, tubers, and fungi that grow naturally, and for meat they eat any living creature—bird, beast, and reptile—except the dog. Tobacco is raised and smoked. They have no cotton or flax, and for the most part wear no more clothing than an ornamental girdle about the loins. They have goats, dogs, and poultry, but cattle and sheep are rare. Iron is plentiful, and is worked with much skill for use and for ornament. Iron also forms their currency. They have drums, horns, and stringed instruments, in which they take great delight. Marriage is by purchase, and no man is allowed more than three wives. Tattooing is practiced to some extent. Their sepulture resembles that of the Peruvians, the corpse being found in a crouching position with the knees drawn up to the chin; the tombs are frequently marked by rough wooden figures intended to represent the deceased. Of the immortality of the soul they seem to have no notion; and their nearest approach to an idea of a Deity is manifested in a vague reverence for luck; but they believe intensely in goblins and witches in great variety, which are identified with owls, bats, and other noxious animals. Their language is copious and musical, abounding in the vowels *O* and *A*, and is of simple grammatical structure. They number less than 100,000, and are subject to the people of Khartoom.

BONHEUR, ROSALIE (more commonly called ROSA), a female French artist, b. at Bordeaux on the 22d of Mar., 1822. Her first master was her own father, Raymond Bonheur, an artist of merit, who died in 1853. In 1841, Mademoiselle B. contributed for the first time two small pictures to the French exhibition, "Two Rabbits," and "Goats and Sheep," which indicated the department in which she was to attain such eminence. These were followed by a succession of highly finished compositions; the year 1849 producing what some consider her finest picture, "Tillage in Nivernais," which has been placed in the collection of the Luxembourg. In 1853, her famous "Horse Fair" was the principal attraction of the Parisian exhibition; and in 1865 she sent to the universal exhibition at Paris a new landscape of large dimensions, "The Haymaking Season in Auvergne." Since 1849, Mademoiselle B. has directed the gratuitous school of design for young girls. During the siege of Paris, 1870–71, her studio and residence at Fontainebleau were spared and respected by special order of the crown prince of Prussia.

BONHOMME, a co. in s.e. Dakota, on the Missouri river; 525 sq. m.; pop. '70, 608; '80, 5561. It is an agricultural region. Co. seat, Bonhomme.

BO'NI, or BO'NY, a kingdom of the s.w. peninsula of the island of Celebes, in the South Pacific ocean. It was formerly the most powerful state in Celebes, but since 1859 has been practically a Dutch dependency. In the n., the scenery is fine, and the soil fertile—rice, sago, and cassia being produced. The inhabitants engage in agriculture and in the manufacture of cotton, and articles of gold and iron, in which they have a large trade. Their institutions, said to be very ancient, partake of the character of a

constitutional monarchy. The British have twice attacked the Bonese for injuring their commerce, and selling the crews of British ships into slavery. In the second attack, in 1814, the Bonese king was killed. Pop. 200,000.—B., GULF OF, separates the s.e. and s.w. peninsulas of Celebes. It is 200 m. long, and 40 to 80 m. broad. Numerous shoals render its navigation difficult.

BONIFACE, the name of nine popes, most of whom are of no historic note.—B. I. (418-422) was appointed, contrary to canonical rule, by the emperor Theodosius II., upon account of prevailing party divisions. He was the first who assumed as bishop of Rome the title of first bishop of Christendom.—Boniface III., who was pope only for ten months in the year 607, was the first to whom the title of universal bishop of Christendom was conceded by the Greek emperor (Phocas).—B. VIII., previously Benedict Cajetan, a native of Anagni, was elected pope on Dec. 24, 1294. His inauguration was distinguished by great pomp: the kings of Hungary and Sicily held the reins of his horse as he proceeded to the Lateran, and with their crowns upon their heads, served him at table. He failed, however, in his attempts to assert a feudal superiority over Sicily, and to exercise his papal authority in the disputes between France and England. Philip the fair, of France, supported by his states and clergy, maintained the independence of the kingdom, disregarding many bulls and briefs, and even the sentence of excommunication to which the pope proceeded. Philip at last, with the aid of Italian enemies of B., made him prisoner at Anagni, to which he had fled; and although he was liberated by the people of Anagni after two days' imprisonment, he died within about a month (1303 A.D.), in consequence of having refused food during these two days, through fear of poison. He instituted the Roman jubilee in the year 1300. If the charges, however, which Philip the fair brought against B. in self-defense—viz., heresy, simony, licentiousness, etc.—were well founded, and regarding the second there can be no doubt, Dante was quite justified in giving him a place in hell. Apart from the question of his personal character, B. was undoubtedly one of those dangerous ecclesiastics in whose downfall civilization exults.—B. IX. (Peter Tomacelli), a native of Naples, succeeded Urban VI. as pope at Rome in 1389, whilst Clement VII. was pope at Avignon. He exceeded all his predecessors in the shameless sale of ecclesiastical offices and benefices, and of dispensations and indulgences. He acquired, after a struggle, a most despotic power in Rome, which he kept in awe by fortresses; but to secure himself against external enemies, particularly Louis of Anjou, whose claim to the crown of Naples he had opposed, he was obliged to give away part of his territory in fiefs, as Ferrara to the house of Este. He died in 1404.

BONIFACE, SAINT, "the apostle of Germany," whose original name was Winfried, was born in Devonshire, England, about 680. He first entered a monastery in Exeter, at the age of 13, and afterwards removed to that of Nutcell, where he taught rhetoric, history, and theology, and became a priest at the age of 30. At that time, a movement, proceeding from England and Ireland, was going on for the conversion of the still heathen peoples of Europe; in 614, Gallus and Emmeran had been sent to Alemannia, Kilian (murdered 689) to Bavaria, Willibrord (died 696) to the country of the Franks, Swidvert to Friesland, and Siegfried to Sweden. Winfried, also, took the resolution (715) of preaching Christianity to the Frisians, among whom it had as yet found no entrance. But a war broke out between Charles Martel and the king of the Frisians, and Winfried returned from Utrecht to his convent, of which he became abbot. Still bent upon his design, he repaired to Rome in 718, and received the authorization of pope Gregory II. to preach the gospel to all the tribes of Germany. He went first to Thuringia and Bavaria, then labored 3 years in Friesland, and traveled through Hesse and Saxony, everywhere baptizing multitudes, and consecrating their idolatrous groves as churches. In 723, Gregory II. called him to Rome; made him bishop, with the name of Bonifacius; furnished him with new instructions or canons, and with letters to Charles Martel and all princes and bishops, requesting their aid in his pious work. Returning to Hesse (724), he destroyed the objects of heathen worship (among which are mentioned an oak near Geismar, sacred to Thor, and an idol named Stuffo, on a summit of the Harz, still called Stuffenberg), founded churches and convents, and called to his aid priests, monks, and nuns from England, whom he distributed through the various countries. In recognition of his eminent services, Gregory III. sent him (732) the pallium, and named him archbishop and primate of all Germany, with power to establish bishoprics wherever he saw fit. B. now made a third journey to Rome (738), and was appointed papal legate for Germany. The bishoprics of Regensburg, Erfurt, Paderborn, Würzburg, Eichstädt, Salzburg, and several others, owe their establishment to St. Boniface. The famous abbey of Fulda is also one of his foundations. He was named archbishop of Mainz by Pipin, whom he consecrated as king of the Franks at Soissons (752), and he presided in the council held at that place. In 754, he resumed anew his apostolical labors among the Frisians; and at Dokkum, about 18 m. n.e. of Leeuwarden, in w. Friesland, this venerable Christian hero was fallen upon by a mob of armed heathens, and killed, along with the congregation of converts that were with him (755). His remains were taken first to Utrecht, then to Mainz, and finally to Fulda. In the abbey, there are still shown a copy of the gospels written by him, and a leaf stained with his blood. A collection of his letters, and the canons he promulgated for

the discipline of the newly established churches, have been preserved, and are instructive as to the state of Germany at the time. The completest edition of the Letters (Epistolæ) is that of Würdtwein (Mainz, 1789). In 1811, a monument was erected to St. B. on a hill near Altenberga, in the principality of Gotha, where, according to tradition, he had erected (724) the first Christian church in North Germany. A statue by Henschel of Cassel was also erected to him in Fulda in 1842. Rittberg, *Kirchengeschichte Deutschlands* (vols. i. and ii., Gott. 1845).

BONIFA'CIO, STRAIT OF, the modern name of the strait between Corsica and Sardinia, the *Fretum Gallicum* of the Romans. At the narrowest part it is only 7 m. wide. The navigation is difficult, owing to the great number of rocks, which, however, are favorable to the production of coral, and the coral and tunny fisheries are actively prosecuted. At the eastern entrance of the strait lie the Bucinaric or Magdalen islands, the *insulæ Cuniculariæ* of the ancients, principally inhabited by Corsicans, but mostly belonging to Sardinia. The strait receives its name from the small town of Bonifacio in Corsica, strongly situated upon a rocky promontory, with an excellent harbor and 3300 inhabitants. It was a place of much consequence to the Genoese for the security of their trade in these seas, and a number of very fine churches still attest its former greatness.

BONIL'LO, a t. of Spain, in the province of Albacete, and 34 m. w.n.w. from Albacete. Pop. 5980.

BONIN, or **ARCHBISHOP ISLANDS,** in the Pacific, stretching in n. lat. between 26° 30′ and 27° 44′, and in e. long. between 142° and 143°. They were discovered in 1827 by capt. Beechey of the *Blossom*, who took formal possession of them for England. They would appear to have been then uninhabited, though at one time a Japanese colony. In 1830, however, Peel island, near the center of the group, was settled, in connection with the whaling business, by a motley colony—an Englishman, an Italian, a Dane, 2 Americans, and 15 Sandwich islanders (5 men and 10 women)—under the auspices of a "union-jack." The inhabitants adopted a constitution in 1853. Besides pigs, goats, and fowls, Peel island produces sweet potatoes, maize, onions, yams, pumpkins, melons, lemons, tobacco, and sugar-cane. Timber also is plentiful, though not of sufficient size for masts.

BONIN (or ARCHBISHOP) ISLANDS (*ante*), called by the Japanese OGASAWARA, after the daimio who first held them in fief in 1593, or after the navigator of the same name who visited them later. In 1675, a party of Japanese explorers from Nagasaki visited them, and finding them uninhabited, called them Bunin ("no man's"), whence our Bonin. In 1823, capt. Coffin, of the American whaler *Transit*, landed on the most southern island, and named it after himself, which capt. Beechey knew when he arrived in 1826. In 1854, com. M. C. Perry stocked the island with sheep, goats, and cattle, and Bayard Taylor wrote a fine description of the group. In 1877, there were on the island 25 Americans, 17 Englishmen, and a motley company of Hawaiians and others, numbering in all 70 persons. In 1878, it was formally taken possession of, colonized, and a local government established by the mikado. Coffin island is the suggested site of the terminus of the proposed trans-Pacific submarine cable from California to Japan.

BONI'TO, a name common to several fishes of the mackerel family, or *scomberidæ* (q.v.). One of these, *thynnus pelamys*, sometimes called the stripe-bellied tunny, and of the same genus with the tunny (q.v.), is well known to sailors as an inhabitant of tropical seas, and as one of the fishes most frequently seen pursuing the flying-fish. It is often taken by an imitation flying-fish made to skim along and touch the waves. Its flesh, although relished by those who have been previously confined to salt provisions, is dry. It is occasionally but rarely caught on the British coasts. It is a very beautiful fish, seldom exceeding 30 in. in length, of a beautiful steel-blue color, darker on the back, and whitish below. Four dark lines extend along each side of the belly. The general form resembles that of the mackerel, but is less compressed.—The B. of the Mediterranean (*pelamys sarda*) is a fish very similar to this, but of an allied genus, distinguished by its comparatively large and strong teeth. It has dark transverse bars reaching from the ridge of the back to the lateral line. It is plentiful in the Black sea. —The plain B. (*auxis vulgaris* or *A. rocheanus*) may be distinguished at once from both of these by its more uniform blue color, without stripes or bands, and by the widely separated dorsal fins. It has only one row of minute teeth in each jaw. It is found in the Mediterranean, and in some places seems to bear, in common with the last-mentioned species, the name bonito. Its flesh is little esteemed when fresh; it is generally used either salted or pickled. Like mackerel, it putrefies rapidly, unless means are used for its preservation. This fish has been occasionally caught on the coast of England, and one was taken in summer 1859, in a herring-net, off the coast of Banffshire.—Another species of *auxis*, a native of the West Indian seas, equals the tunny in size.

BONN, a t. of Rhenish Prussia, beautifully situated on the left bank of the Rhine, 15 m. above Cologne. Pop. '75, inclusive of the military, 28,114. B. is connected with the right bank of the Rhine only by a ferry, and with Cologne by the railway as well as the river. The cathedral church is a fine specimen of the last period of the Romanesque style, and exhibits the transition to the Gothic already begun. B. has considerable manufactures of cotton goods, earthenware, vitriol, and soap. The neighborhood is

very romantic. B. is the seat of a number of learned associations and institutions. The Leopoldine academy of physical science, founded at Vienna in 1652, was transferred to B. in 1818. It obtained a university in 1786, which, however, was suppressed during the sway of France; and the present university was founded in 1818, receiving from government the former electoral palace and other buildings, with an annual revenue of nearly £15,000 sterling. There are two theological faculties, the one Protestant, and the other Roman Catholic. The university had, in 1875, 102 professors and lecturers, and 724 students; and among its professors have been numbered some men of high distinction, as Niebuhr and A. W. Schlegel. Albert, the late prince consort, was a student here. Its clinical establishments are of unusual extent, and admirably arranged. It has a library of above 200,000 volumes, archæological and other collections, a botanic-garden, an observatory, an agricultural school, a riding-school, etc. B. derives its origin from *Bonna*, one of the castles erected by the Romans in Germany. It was long the residence of the electors of Cologne; it was taken from the French in 1689, after a severe bombardment by the elector Frederic III. of Brandenburg; and in 1703, it surrendered, after a siege, to the English and Dutch army under Marlborough. It returned again into the possession of the elector of Cologne in 1715, and in 1717 its fortifications were razed. It was acquired by France in 1802, and assigned to Prussia in 1814. Beethoven was a native of Bonn.

BONNER, EDMUND, Bishop of London, was b. of obscure and doubtful parentage, about the end of the 15th century. The reputation he gained at Oxford by his knowledge of the canon law, recommended him to the notice of Wolsey, who promoted him to several offices in the church. After the fall of Wolsey, B. took an active share in the work of reformation, and received due promotion from Henry VIII. In 1533, he was deputed to appear before the pope at Marseilles, to appeal for the excommunicated monarch to a general council. The violence of his threats on this occasion suggested to his holiness the fitness of having him burned alive, or thrown into a caldron of melted lead, so that B. judged it prudent to leave Marseilles without notice. In 1540, he was made bishop of London. The death of Henry cooled his Protestant zeal; and having given proofs of his lukewarmness in the cause of reformation, he was at length, in 1549, committed to the Marshalsea, and deprived of his bishopric. The accession of queen Mary restored him to office, and gave him the opportunity of revenge, which he now took without delay or stint. As vice-gerent and president of the convocation, he was the principal agent in that bloody persecution which has made the reign of Mary infamous. On the accession of Elizabeth in 1558, B. accompanied his episcopal brethren to salute her at Highgate, but was excepted from the honor of kissing her hand. In May, 1559, he was summoned before the privy council, and refused, with a consistency worthy of due respect, to take the oath of supremacy. He was accordingly deposed from his bishopric, and shut up in the Marshalsea, where he died in 1569. While it is right to remember with detestation the multitude of B.'s cruelties, one also ought not to forget that he was strict in castigating the lax morality of his clergy; that after his return to popery, he remained steadfast to his principles; and that he bore his final misfortune with manly resignation.

BONNER, ROBERT, b. 1824; a printer who established the *New York Ledger* in 1851, and by a new and attractive system of advertising acquired for it an unprecedented circulation. It is a family literary journal, without advertisements. B. is also known as an owner of fast horses, and has had at one time more than a hundred of the most valuable, obtained without regard to cost.

BONNET, in fortification, is a small defense-work constructed at the salient angles of the glacis or larger works. It consists of two faces only, with a parapet 3 ft. high by 10 or 12 broad. There is no ditch. A larger kind, with three salient angles, is called a priest's B., or *bonnet à prêtre*. The use of the B. is to check the besiegers when they are attempting to make a lodgment.

BONNET, a covering for the head, of which there are many varieties. The French, from whom we have the word, apply it as we do to male as well as female head-dress. A kind of night-cap is called by them a B ; as, for example, the *bonnet rouge*, or infamous "cap of liberty" of the revolutionary leaders. The English B. of former times was made of cloth, silk, or velvet, less or more ornamented, according to the means or taste of the wearer. This species of head-gear was generally superseded by the hat, in the early part of the 16th c.; but in Scotland, bonnets were universally worn for a century to two centuries later, and they still remain to a certain extent a national characteristic. From the frequent notice of the blue B. in historical records and in song, it would seem that the Scotch were long identified with this kind of head covering. The genuine old B. of the Lowland Scottish peasantry was of a broad, round, and flat shape, overshadowing the face and neck, and of a dark-blue color, excepting a red tuft like a cherry on the top. The fabric was of thick milled woolen, without seam or lining, and so exceedingly durable that, with reasonable care, a single B. worth about 2*s.* would have served a man his whole life. No head-dress ever invented could stand so much rough usage. It might be folded up and put in the pocket, or laid flat and sat upon, with equal impunity; it might be exposed to a heavy drenching rain without the head being wetted, and when dried, it was as good as ever. Besides it could be worn on the top of the head, or slouched

in front, behind, or sidewise, as a protective against a cold blast; and from its softness and elasticity, it very fairly saved the head from the effects of a blow. In short, there was no end to the adaptability of the old "braid bannet," as the Scotch termed it; and one almost feels a degree of regret that, in the progress of fashion, it should have gone so much out of use. From having been worn, till comparatively late times, by small rural proprietors—such as owners of a cottage and an acre or two of land—it gave to these local notabilities the distinctive appellation of *bonnet lairds*. A lesser and not so broad a variety of the B. was worn by boys. The Highlanders have long worn bonnets of the same fabric, but these rise to a point in front, and are without any rim. Such is the cap now known as the *Glengarry bonnet*. From time immemorial, these various kinds of Scots bonnets have been manufactured at Stewarton, a small town in Ayrshire. Formerly, the Stewarton bonnet makers formed a corporation, which, like other old guilds, was governed by regulations conceived in a narrow and often amusingly absurd spirit; one of the rules of the fraternity, however, can be spoken of only with commendation, for it enforced a certain weight of material in each B., as well as durability in the color. An account of this ancient corporation will be found in *Chambers's Journal*, first series, vol. v., p. 142. The bonnets used in the Highland regiments are made at Stewarton and Kilmarnock; they are usually distinguished by a checkered fillet, being the *tressé chequé* of the house of Stuart. Latterly, although hats and caps have, to a great extent, superseded bonnets of the old varieties, the bonnet manufactories of Stewarton have much increased, and are still increasing. Of the many and ever-shifting varieties of ladies' bonnets of straw, silk, and other materials, we not need attempt any account.

BONNET, CHARLES, an eminent naturalist and philosopher, b. at Geneva, 13th Mar., 1720. He was educated for the profession of the law, but devoted himself at a very early age to the study of natural history. A dissertation on aphides obtained for him, in 1740, the honor of being made a corresponding member of the academy of sciences in Paris. He was soon afterwards occupied in researches concerning polypi, the respiration of insects, the structure of the tape-worm, etc. He published his *Traité d'Insectologie* (2 vols., Par.) in 1745. His *Recherches sur l'Usage des Feuilles des Plantes*, published in 1754, contained the result of much observation on important points of vegetable physiology. A severe inflammation of the eyes, putting a stop for two years to his researches in natural history, gave another direction to his studies, and he published several works on psychology, in which materialistic views decidedly prevail; the body is represented as the original source of all the inclinations of the soul, and all ideas are referred to movements of the nervous fibers; but his religious convictions remained always strong and unshaken, and in his *Idées sur l'Etat Futur des Etres Vivants, ou Palingénésie Philosophique* (2 vols., Gen. 1769), he endeavored to demonstrate the reasonableness of the Christian revelation. In this work he also maintained the future life of all living creatures, and the perfection of their faculties in a future state. Lavater translated the last part of it, and it helped to effect a change in the religious tendencies of Mendelssohn. His *Considérations sur les Corps Organisés* (2 vols., Gen. 1762) is very much devoted to an examination of the theories of generation. B. was for some years a member of the great council of his native city. He died on 20th May, 1793. In the latter part of his life, he superintended a collective edition of his own works (8 vols. and 18 vols., Neuch. 1779–88).

BONNET-PIECE, a gold coin of James V. of Scotland, so called on account of the king's head being decorated with a bonnet instead of a crown, as was usual. James V. was the first Scottish sovereign who placed dates on his money, and the first who diminished the size of the gold coins "by increasing their thickness. The most remarkable are those commonly called the bonnet-pieces, which were struck of native gold; in beauty and elegance of workmanship, they approach the nearest to the Roman coins, and very much surpass all the coinage at that period, or ever since." These bonnet-pieces are among the most valued curiosities of the antiquary.

BONNEVAL, CLAUDE ALEXANDRE, Count de, also called Achmed Pasha, a French adventurer, whose history is very extraordinary. He was born of a noble family at Coussac, in Limousin, in 1675; proved unmanageable at the Jesuit college; and was placed in the royal marine corps in his 13th year. He was transferred to the guards; served with great distinction in Italy and the Netherlands; but having been refused promotion, upon account of some excesses of which he had been guilty, he behaved with great insolence to the minister at war, and was therefore condemned to death by a court-martial. Foreseeing this result, he fled to Germany, where, upon the recommendation of prince Eugene, he obtained employment in the Austrian service. He now fought against his native country, distinguished himself by many daring exploits, was raised to the rank of lieut.-field-marshal, and bore a principal part under prince Eugene in the war between Turkey and Austria. But when residing at Vienna, after the peace of Passarowitz, he made himself very disagreeable to the prince, and was therefore sent, in 1723, as master-gen. of ordnance to the Netherlands, where he soon got into a scandalous quarrel with the governor, and was brought to trial, and condemned to death by a court-martial. The emperor commuted the sentence to one year's imprisonment; and upon condition of never again setting foot upon German soil, he was conveyed across the Tyrolese frontier. He went to Constantinople, was cordially welcomed, became a

Mohammedan, took the name of Achmed, was made a pasha of three tails, was employed in organizing the Turkish artillery after the European manner, achieved successes as general of a division of 20,000 men in the war of the Porte with Russia, and arrested the victorious career of the Persian usurper, Thamasp Kuli Khan. For this service, the sultan appointed him governor of Chios; but his own imprudence, and the envy of others, caused his removal from this office. He now thought of leaving Turkey, but died at Constantinople on 27th Mar., 1747. The memoirs published as his are spurious.

BONNEVILLE, Benjamin L. E., b. France about 1795, a graduate of West Point. In 1820, he was constructing a military road in Mississippi; next on frontier duty, and in 1831 started on an exploring expedition to the Rocky mountains and was not heard from for several years. He served in the Florida and Mexican wars, rising to the grade of col., and in 1861 was retired on account of disability, but served during the civil war as superintendent of the recruiting service in Missouri, being raised to brig-gen. in 1865. Washington Irving edited the *Adventures of Captain Bonneville, U.S.A., in the Rocky Mountains and the Far West.*

BONNIVARD, François de, 1496–1570; the "prisoner of Chillon." He was educated at Turin, and in 1510 succeeded to the priory of St. Victor, near Geneva. He upheld the cause of the Genevese against the duke of Savoy, and when the duke took the city he was imprisoned for two years. Being liberated, he returned to his priory; but in 1530, while traveling in the service of the republic, he was captured by robbers, and given to his enemy the duke, who imprisoned him in the castle of Chillon until 1536, when he was liberated by the Bernese and Genevese forces. He returned to Geneva (which city was now entirely emancipated), and enjoyed the honors and rewards due to his patriotism, being made one of the council of two hundred. He was the author of a history of Geneva, and left his books and manuscripts to that town.

BONNYCASTLE, Charles, 1792–1840; b. in England; son of John, the English mathematician. He assisted in compiling his father's text books, and was the first professor of natural philosophy in the university of Virginia, and also professor of mathematics. He wrote *Inductive Geometry*, and several papers on scientific topics.

BONNYCASTLE, John, long professor of mathematics at the royal military academy, Woolwich, is well known as the author of many excellent elementary works, chiefly mathematical. He was born at Whitchurch, Buckinghamshire, and died at Woolwich in 1821. His *Elements of Algebra* (2 vols. 8vo, 1813) is selected by a capable critic, from among his other works, as specially deserving of commendation.

BONNY RIVER, a river of Guinea, w. Africa, forming the eastern debouchure of the Niger, and falling into the bight of Biafra, in about lat. 4° 30′ n., and long. 7° 10′ east. It is accessible at all times of the tide to vessels drawing as much as 18 ft. of water, and safe anchorage at all seasons of the year is found within its bar. Its banks are low, swampy, and uncultivated. On the e. side, near its mouth, is the town of Bonny, long notorious as the rendezvous of slave-trading ships. It exports considerable quantities of palm oil.

BONPLAND, Aimé, an eminent botanist, was born at La Rochelle, France, Aug. 22, 1773. Having studied medicine and botany at Paris, he accompanied Alexander von Humboldt in 1799 to America, where they traveled nearly five years, mostly in Mexico and the Andes, during which time B. collected 6000 new species of plants. After his return, he was appointed, in 1804, director of the gardens at Navarre and Malmaison, and published several splendid and valuable botanical works, *Plantes Equinoxiales Recueillies au Merique*, etc. (2 vols., Par. 1808–16, with 140 copper-plates); *Monographie des Mélastomées*, etc. (2 vols., Par. 1809–16, with 120 copper-plates); and *Description des Plantes rares de Navarre et de la Malmaison* (11 numbers, Par. 1813–17, with 64 copper-plates). He went to Buenos Ayres in 1816, with a collection of European plants and fruit-trees, was favorably received by the government, and named professor of natural history. After remaining at Buenos Ayres about five years, B. undertook an expedition of scientific discovery up the Paraña, with the view of prosecuting his investigations to the Andes, across the Gran Chaco desert; but Dr. Francia, then dictator of Paraguay, instead of giving him permission to cross the country, arrested him, after killing some of his men, and kept him prisoner for about nine years, notwithstanding the efforts of the British government, at the instigation of Humboldt, to obtain his release. While detained by Dr. Francia, he acted as physician of a garrison. On the 2d of Feb., 1831, he obtained his liberty, and traveling southward, settled on the southern boundary of Brazil, near the eastern bank of the river Uruguay, and in the vicinity of the small town of San Borja. Here he resided until 1853, taking great interest in cultivating and promoting the cultivation of Paraguay tea, and with no desire to return to Europe. In 1853, he removed to a larger estate at Santa Anna, where he busied himself in cultivating orange-trees of his own planting. In 1857, he wrote to Humboldt that he was about to carry his collections and manuscripts to Paris, to deposit them in the museum there, and that after a short stay in France, he intended to return to Santa Anna. That voyage, his death in 1858 prevented him from accomplishing. His remarks on the herbarium collected in his travels with Humboldt, have been given to the world by Kunth in his *Nova Genera et Species Plantarum* (12 vols., Par. 1815–25, with 700 plates).

BONUS, a special allowance, or extra dividend, to the shareholders of a company. If the previous dividend has been 4 per cent on the capital, and if the profits of the current year admit of 5 per cent, a formal dividend of that amount would commit the company to a like dividend in future; and to prevent such a precedent, 4 per cent is declared, and a B. of 1 per cent.

BONYHAD, or BONHARD, a market t. of Hungary, in the colony of Tolna, 20 m. n.e. from Fünfkirchen. Pop. '69, 5610.

BONY PIKE, *Lepidosteus*, an interesting genus of fishes, being one of the few existing genera belonging to an order, *ganoid fishes* (q.v.), of which the fossil forms are extremely numerous, and the only existing genus, which, upon account of the number and arrangement of the bones of the head and other peculiarities of the skeleton exhibiting a resemblance to reptiles, is reckoned among *sauroid fishes* (q.v.). The body is covered with a case of dense bony square scales, so fitted together as to form a complete coat of mail. The vertebræ are articulated by ball and socket, and the head is capable of a degree of motion upon the trunk very remarkable among fishes, and compensating for the general stiffness of the mailed body, the skeleton of which is also bony, and not cartilaginous. The snout is elongated, and the edges of the jaws are furnished with long teeth, the breadth of the snout in some of the species giving it a resemblance to that of the pike. The tail is *heterocercal*, or unsymmetrical, the caudal rays being inserted not equally above and beneath the termination of the vertical column, but only at and beneath it, a character much more common in fishes of the old red sandstone than in those of the present period.—The species of this genus are pretty numerous, attain a large size, and are found in the rivers and lakes of the warm parts of America. They are much esteemed for the table.

BONZES, the Japanese priests of Fo or Buddha. The name is from the Japanese *Busso*. It was extended by the Portuguese to Buddhist priests in other countries, but particularly to the Chinese. See JAPAN and BUDDHISM.

BOO'BY, *Sula fusca*, a species of gannet (q.v.) which has received this name from its apparent stupidity in allowing itself to be knocked down with a stick or taken by the hand. Accounts differ very much, however, as to this character of the B., some representing it as singular in not taking alarm or becoming more wary even when it has had reason to apprehend danger from man; others, as Audubon, asserting in such a manner as apparently to place it beyond dispute, that it does learn to be upon its guard, and even becomes difficult to approach within reach of shot. The B. is not quite so large as its congener, the common gannet or solan-goose, and, like it, is a bird of powerful wing, and feeds on fish, which it takes by diving in the sea, observing its prey as it sweeps along the graceful and varying flight, sometimes at a height of only a foot or two from the surface of the water, sometimes 20 yards above it, and plunging suddenly to seize it. It is sometimes taken, like the gannet, by means of a fish fastened to a board, through which it drives its bill, as it dashes at the bait. The B. is of a blackish-brown color, whitish beneath; its colors are subject to some variation, and in young birds a general brown color prevails; the sexes differ very little, except that the female is not quite so large as the male. It is found on almost all tropical and sub-tropical shores, and sometimes even 200 m. from land. On the e. coast of North America, it reaches about as far n. as cape Hatteras, but is much more abundant further s., great numbers breeding on the low islands off the coast of Florida. The nest is often placed upon a low bush, and "is large and flat, formed of a few dry sticks, covered and matted with sea-weeds in great quantity." It contains only one egg or young one at a time. The expansibility of the gullet enables the B. to swallow fishes of considerable size. The bill, which is straight, conical, and longer than the head, opens beyond the eyes, as in the rest of this genus. The B. is much persecuted by the frigate bird (q.v.) and man-of-war bird (q.v.), more powerful birds and of swifter flight than itself, which often compel it to disgorge for their use the prey which it has just swallowed. The flesh of the B., although sometimes eaten by sailors, is dark-colored, and not very agreeable. Bligh and his companions, in his long boat-voyage, found one or two which they captured a providential supply of food.

BOO'BY ISLAND, a level rock in Torres straits, in lat. 10° 36′ s., and long. 141° 53′ e., 3 ft. in height, and ¼ m. in diameter. Being, of course, highly dangerous to navigators, and destitute of resources of its own, it is said to be pretty regularly supplied with provisions and water by passing vessels, for the benefit of such as may be cast ashore on it.

BOODROOM, BOUDROUM, or **BODRUN**, a seaport t. in Asiatic Turkey, in the pashalic of Anatolia, finely situated on the n. shore of the gulf of Kos, about 96 m. s. of Smyrna, in lat. 37° 2′ n., and long. 27° 25′ east. It is an uninviting place, its streets being narrow and dirty, and its bazaars of the worst class; but as the site of the ancient *Halicarnassus*, the birth-place of Herodotus and Dionysius, it possesses great interest for the traveler. Many remains of the old city, which was "the largest and strongest in all Caria," bear witness to its former magnificence. A fortress, built by the knights of Rhodes in 1402, occupies a projecting rock on the e. side of the harbor, which is shallow but well sheltered, and resorted to by Turkish cruisers. Some ship-building is carried on. Pop. stated at about 11,000.

BOOK, a distinct literary production in one or more volumes; but the term B. is also applied to a treatise, or group of chapters, forming a part of a volume, and traditionally it signifies a narrative, or record of some kind in the form of a roll: "Lo, a roll of a book was therein; and he spread it before me; and it was written within and without."—*Ezek.* ii. 9, 10. The term has a similar meaning in English law phraseology. "In the court of exchequer, a roll was anciently denominated a book, and so continues in some instances till this day. An oath as old as the time of Edward I. runs in this form: 'And you shall deliver into the exchequer a book fairly written,' etc., but the B. delivered into the court in fulfillment of this oath has always been a roll of parchment."—Godson and Burke *On the Law of Patents and Copyrights* (Lond. 1851, p. 323).

The word B. is from the Anglo-Saxon *boc*, and, with some modifications of spelling, is common to all the Teutonic and Scandinavian languages (Ger., *buch;* Dutch, *boek*). It is believed to be derived from the same root as *beech* (Angl.-Sax. *boc;* Ger. *buche;* Icel. *beyke;* Dutch, *beuke*), the earliest writing among those nations having been executed on the inner bark of the beech-tree, or perhaps carved on beech boards. The Greek word for a B., *biblos*, or more commonly, *biblion*, is derived from the Egyptian appellation for the plant papyrus (q.v.). The Latin word *liber*, a B., is derived from the name of the cellular tissue of the papyrus, instead of the plant itself. By the Greeks, a collection of books was called *bibliotheca*, and by the Romans, *libraria;* hence the French term *bibliotheque*, and the English word *library;* hence, also, the *librarii*, or book-writers, and *bibliopolæ*, booksellers, of the Romans. Properly prepared in long strips, the papyrus was wound round small cylinders, or rollers, which in Latin were styled *columina;* hence the English word volume. As the papyrus has also given the term paper to the moderns, it has played an important part in the naming of what concerns books. Besides papyrus, however, the ancients used parchment and other materials for the fabrication of their books; and when, by the capture of Egypt by the Arabs in the 7th c., the papyrus plant could no longer be procured, parchment was the material generally employed.

By the Romans after the Augustan age, the art of fabricating books reached a degree of proficiency, along with the advancement in literature. The papyrus was carefully prepared; one side was reserved for the writing, and the other was colored with saffron or cedar oil. The writing was effected by a pen made of a reed (*calamus*), of which the best kinds were supposed to be found in Egypt. The ink (*atramentum*) was very durable. In several rolls found at Herculaneum, the Roman ink, after being interred many centuries, is still in good preservation. When a Roman author wished to give his book to the world, a copy was put into the hands of transcribers (*librarii*), by whom a certain number of copies were produced. From these transcribers, who were equivalent to our modern printers, the copies passed to a class of artists (*librarioli*), who ornamented them with fanciful titles, margins, and terminations. The rolls were finished for use by the *bibliopegi*, or book-binders; and last of all, they were offered for sale by the *bibliopolæ*, or book-sellers. A copy of one of the esteemed productions of a Roman author—as, for example, a copy of Virgil or Horace—was an elegantly done-up roll, about 13 in. in depth, wound round a cylinder, the two ends of which were decorated with ivory or metal knobs. Outside, it bore various decorations along with the title, and for safety was put in a neat case of parchment or wood, which also bore sundry ornamental devices, including perhaps a portrait of the author. A book-seller's shop in ancient Rome would probably show a collection of scrolls, less or more ornamented, not unlike in appearance to modern small maps mounted on rollers; and in this form books would be handed about and read. Prized for their rarity and costliness, these scroll-books were kept with great care in cases, or round-shaped boxes with lids, made of cedar; the odor of that wood being a preservative against moths and other destructive insects. Romans with a literary taste carried one of these boxes of scrolls with them as a portable library. A public library comprised a large variety of these boxes, and must have had the appearance of a collection of round canisters. Yet the Romans did not invariably make their books in rolls; in some instances, they used leaves of lead, which had been beaten thin with a hammer, and also leaves of wood covered with wax; these loosely connected at the back with rings, may be viewed as the rude original of the modern book. At Herculaneum, books of this kind, called tablets, have been discovered in perfect preservation.

In producing books during the middle ages, the plan of rolls was dismissed, and that of leaves sewed together and inclosed in boards came generally into use. The material employed was still parchment, prepared from the skins of goats, sheep, deer, and other animals; for although the art of making paper was known in the 9th c., this new material came slowly into use. The fabricators of the books were for the most part different orders of monks, more particularly the Benedictines (q.v.), a learned and industrious body of men, whose peaceful establishments were long the great centers whence literature was dispersed in ages of intellectual darkness and social disorder. At the head of the book-manufacturing department in the monastery was the *armarian*, who, besides taking charge of the library, gave out books to be copied, along with the pens, ink, and parchment required by the transcribers. Some of the monks were allowed to transcribe in the solitude of their cells, but the business of transcription was conducted chiefly in an apartment called the *scriptorium*, which was provided with ranges of desks and forms. There, the scribes or copyists, who were under strict regulations as to keeping silence, carried on their tedious but useful labors. The writing was effected in dis-

tinctly formed letters in an old character; regularity in the lines and pages being secured by previous ruling. There was an injunction that no one should on any account alter a single letter or word, without the sanction of the superior. With all the care that was bestowed, however, errors crept in, and were repeated from copy to copy, some of which mistakes have sorely puzzled the scholarly inquirers of later times. There was a division of labor in the monasteries. To some of the monks was assigned the duty of throwing in embellishments. With leaf-gold and brilliant water-colors, they adorned the devotional works, lives of saints, and copies of the Scriptures with pictorial illustrations and fancifully illuminated letters at the beginning of chapters. By another class of these monkish artists, the books were bound in styles suitable to the quality of the works. In many instances, the binding was superb. The boards of wood, covered with leather or velvet, were decorated with precious stones and devices in metal; and in front, the volume was held together with clasps of gold or silver-gilt. Skelton, the poet-laureate, in his *Garland of Laurel*, written about the year 1510, rapturously alludes to the splendid bindings of those old times:

> With that of the boke losende were the claspis:
> The margent was illumynid all with golden railles
> And byse, enpicturid with gressoppes and waspis,
> With butterflyis and freshe pecoke taylis,
> Enflorid with flowris and slymy snaylis;
> Envivid [enuiuid] picturis well towchid and quikly;
> It would haue made a man hole that had be right sekely,
> To beholde how it was garnisshyd and bounde,
> Encouerde ouer with golde of tissew fyne;
> The claspis and bullyons were worth a thousande pounde;
> With balassis* and charbuncles the borders did shyne;
> With *aurum musicum*† euery other lyne
> Was wrytin: . . . . .

"A book usually known by the name of *Textus Sanctus Cuthberti*, preserved in the Cottonian library, is a fine specimen of Saxon caligraphy and decoration of the 7th century. It was written by Eadfrid, Bishop of Durham; and Ethelwold, his successor, executed the illuminations, the capitals, and other illustrations, with infinite labor and elegance. Bilfrid, a monk of Durham, covered the book and adorned it with gold and silver plates set with precious stones. We find also that Dageus, a monk who flourished in Ireland in the early part of the 6th c., was a skillful caligraphist, and manufactured and ornamented binding in gold, silver, and precious stones."—*Hunnett's Inquiry into the Books of the Ancients* (Lond. 1843). Books of a common quality were plainly bound in parchment, and instead of clasps they were tied in front with thongs. In order to enable monasteries to sustain the expense incurred by their book-fabricating establishments, they were occasionally endowed with lands by pious laymen, the bequests being expressly for "the making and mending of books." Among the works produced were copies of the Scriptures, in whole or in part; breviaries or books of prayers used in the church services; missals, psalters, books in philosophy, and copies of the Greek and Latin classics and fathers; also legends of the saints. Books of history, poetry, romance, etc., were less commonly transcribed; though, from the extent of some of the mediæval libraries, these and various other subjects were not neglected. Indeed, but for the monks we should have possessed scarcely any chronicles of the middle ages; nor are we less indebted to them for the preservation of those classics which are now habitually used in our colleges and academies.

The method of dispersing the books was not less remarkable than that of their transcription. Some of the books were sold at exorbitant prices; some were executed to the order of kings, nobles, and church dignitaries; some were exchanged; and some found their way into the hands of the *stationarii*, or dealers in books, in the principal cities. It was customary to lend books for transcription, under an agreement to receive an additional copy on their return. In all cases of lending books, penalties were stipulated to be paid in the event of their not being restored. Latterly, there sprang up a practice among the *stationarii* of Paris, and some other cities, of lending out books, at certain rates, on the principle of a circulating library (q. v.), by which means the poorer class of students and others were accommodated. In these later times, also, as we approach the period when printing superseded transcription, the process of copying books began to be undertaken by lay scribes for a livelihood, of which there were examples in London. To the monks, however, and also to some orders of nuns, belongs the unspeakable merit of having not only supplied the religious orders with the books which were in daily use, but those which replenished the libraries of the learned and wealthy, until their ingenious craft was supplanted by that of the printer and bookseller. In the higher-class monasteries there were libraries of from 500 to 1,000 volumes; but many of the poorer conventual establishments could boast of no more than from 20 to 30 books. In the list of effects which belonged to a monastery in Scotland—St. Serf, on an island in Loch Leven—there appear only 16 books; and yet, in this poorly provided insular establishment, the prior, Andrew Wintoun (1420), completed his *Oryginale Cronykil of Scotland*, a work in verse, which is not less valuable as a picture of ancient manners than as a specimen of the attainments of the old monkish writers. But there are said to have

* Balassis—rubies.
† *Aurum musicum*—mosaic gold.

been instances of a greater scarcity of books than in St. Serf's. Often, only two or three breviaries and missals, a psalter, and a copy of the Gospels, were all the books owned by a religious house. The possession of an entire copy of the Scriptures (the Latin version of St. Jerome) gave immense importance to a monastery or church. Nor was this surprising, when the enormous labor of transcribing a Bible, letter by letter, is considered. Alcuin, a native of England, and one of the most industrious and ingenious monks of his time, occupied himself from about 778 to 800 A.D., a space of 22 years, in making a copy of the Bible for the emperor Charlemagne. This ancient and extremely interesting monument of piety and labor is now in the British Museum, which became possessed of it for the sum of £750. The museum is also enriched with a variety of missals and other works executed by the monks. In the present day, it is scarcely possible to form a correct idea of the value put upon books, even of a common order, or of the prodigious care which was taken of them, during the middle ages. To preserve them from embezzlement, they were in some cases chained to shelves and reading-desks; and in the dwellings of nobles, a volume might be seen chained to a table in the hall, for the use of such members of the family as were able to read.

The establishment of universities in the 12th c. greatly stimulated the manufacture of books by transcription, more particularly those classics and philosophical treatises that were required by students in the colleges. The anxiety of the authorities in these schools of learning to insure accuracy in the text-books, as well as to prevent the use of books of an improper kind, led to the establishment of censorships and privileges which interfered with the preparation of, and traffic in, books, long after the invention of printing. Unfortunately, while this art was superseding the ancient process of transcription, the convulsions consequent on the reformation caused an enormous destruction of books. In England, the libraries of monasteries, representing the labor of a thousand years, were mercilessly destroyed on the spot, or carried off and consumed in base purposes, without a thought as to their value. In Scotland, the monastic libraries which had escaped the ravages of Danish and other invaders, were similarly destroyed. The same fate overtook the ancient monastic libraries of France at the revolution. See LIBRARIES.

In consequence of these deplorable events, as well as the perishableness of books, copies of works prior to the invention of printing exist only as rare and valuable curiosities. Even of the early printed books, there are comparatively few copies extant. In England, books of improved typography and binding, adapted for ordinary libraries, date no further back than the reign of queen Anne. In proportion as literature has been popularized, books have diminished in bulk and costliness. In the 16th and 17th centuries, the ordinary sizes of books were folio and quarto; and as works of these huge dimensions embraced light as well as much ponderous literature, a popular poet uses no metaphor, when he observes that ladies "read the books they could not lift." The dignified quarto survived in imaginative literature even till our own times; for it was in this costly form that the early editions of the poetry of Scott, Byron, and others made their appearance. Excepting for special purposes, all such large sizes are happily superseded by octavos and still lesser-sized books. Forms and prices are no longer for the few, but for "the million." And copies of the Bible, instead of being chained to shelves and desks, and being valued at hundreds of pounds, are now scattered in myriads at the easy charge of a shilling.

The dimensions of printed books are regulated by the size and form of the sheets of paper of which they are composed. A sheet, being folded in the middle, forms two leaves, or four pages; and a book of this size is called a folio. When the sheet is again folded, so as to make four leaves, or eight pages, it forms a quarto. The quarto, being folded across, so as to make eight leaves, or sixteen pages, forms an octavo. By folding the sheet into twelve leaves, or twenty-four pages, we make a duodecimo; and if into eighteen leaves, or thirty-six pages, we form an octodecimo. Below this there are small books of different denominations, and which are sometimes spoken of as pocket editions. Booksellers are accustomed, in speech, to Anglicize the terms for the sizes of books, with little regard to the proper terminations—as 4to, 8vo, 12mo, 18mo, 24mo, 32mo, 48mo, etc. For a long period, printing-paper was made chiefly of three sizes, respectively called royal, demy, and crown; and according as any one of these was employed, the size of the book was large or small. Demy, however, was the most commonly used, and the demy 8vo may be said to have become the established form of standard editions of books. As by means of the paper-making machine, paper is made in webs, and can be cut into every imaginable size of sheet, and as printing-machines can print very large surfaces, the sizes of books are now comparatively arbitrary; though, for convenience, the old names remain, with the difference, that instead of the 12mo, a not very dissimilar size, called the post-8vo, has come extensively into use. The size of the present work is large royal 8vo.

A thin kind of book, consisting of a few sheets sewed or stitched together, without boards, is called a pamphlet—a term supposed to be derived from the French words *par filet*, "by a thread." The French term *brochure* (from *brocher*, to stitch), signifying pamphlet, is coming into use; as also the French word *livraison*, signifying a portion of a book (group of volumes) published separately. For an account of the modern traffic in books, we refer to the article BOOK-TRADE.

W.C.

BOOKBINDING, the art of connecting together in a durable and convenient manner the several parts of a book. The craft of the bookbinder is older than that of the printer. As noticed in the preceding article, the Romans had their *bibliopegi* for doing up their books in rolls; and during the middle ages, the binding of books in a square form was executed by certain orders of monks. As the first style of typography was an imitation of the penmanship employed in Bibles and Missals, so was the binding of the first printed books only a copy of what had been usual in doing up volumes of manuscript. But as printing greatly multiplied books, binding got out of the hands of the monks and other ingenious men who had hitherto carried it on, and assumed the character of a widely dispersed mechanical art, which, like other useful arts, has gone on improving till the present day. It says little for the taste or tact of the Germans, that they, the inventors of printing, should have long since been left behind, not alone as regards typography, but binding, and everything else connected with the preparation of books. The French have exerted their fine artistic taste in binding, and take the lead in this branch of art among continental nations. In the French language, the term *relieur*, used for bookbinder, has oddly enough the same root as *religion* (religo, to bind again). To the English belongs the merit of carrying the art to a high degree of perfection; for no bookbinding in the world excels that of London in solidity, elasticity, and elegance—the three great requisites of a well-bound book—which have been arrived at, not less from skill in manipulation, than the excellence of tools, and the prices which are ungrudgingly paid by wealthy book-fanciers. Reaching this advanced stage, bookbinding forms a regular craft, distinct from printing and bookselling, though in country towns it is sometimes united with these professions. Properly conducted, it is divided into the three departments of preparing, forwarding, and finishing; but in these there are many subdivisions of labor, a few of which may be referred to.

On coming from the press, sheets are first dried by being hung on poles for a length of time, and then smoothed by pressure, singly, between glazed mill-boards in a powerful hydraulic press. They are next collated or arranged in distinct books in quires, in which form they are delivered to the publisher. If, however, for immediate sale in "cloth boards," the sheets are transferred in masses from the printer to the binder, and treated as follows: The first operation is to fold the sheets, by means of a small instrument called a folder. The object is to fold down the different pages so as to fall on one another; and on the perfect accuracy with which this is performed depends the proper binding of the book. Though machines for folding have been invented, and for some kinds of work prove satisfactory, much of this operation is still performed by hand; usually the work is done by girls. After being folded, the sheets of the book are gathered and collated according to the "signatures," A, B, etc., which are printed at the bottom of the first page of each sheet. The books so made up and completed, are now pressed to a proper solidity, by being placed in quantities in a hydraulic press. The next process is to saw indentations in the back of the book, preparatory to sewing. If only a few volumes are to be sawed, the operation is executed with a tenon saw; when, however, there are large numbers, the books are placed on a machine with revolving saws, which instantaneously effect all the indentations. The books are next sewed on a frame, each sheet being attached by a thread to cords across the back. The sewing, though sometimes done by a machine, is chiefly executed by girls. On being removed from the sewing-frame, the book receives its "waste papers," which are pasted to the back on each side. The book is now "trimmed," by being cut on the edges by a knife-apparatus. In some instances, this is effected by the plough-machine on the screw lying bench; in others, the books are piled on a machine, beneath a broad knife, which descends like a guillotine, and a large number are cut with amazing expedition. The books are next glued on the back, to impart a certain degree of firmness. After this, they are "backed" by means of a machine, which imparts a certain roundness to the back, and at the same time gives a seat for the boards. The book, with a slip of canvas pasted on the back, is now ready for receiving the boards, which are previously cut in large quantities by a machine.

The preparing and attaching of the cover forms the final stage of the process. For the whole of the class of boarded books we have been describing, there is a method of making "cases." A case consists of cloth or paper pasted on two boards, the distance of the boards from each other being equal to the thickness of the book. The case being finished, receives the book, to which it is attached chiefly by pasting it to the canvas of the back and the blank or waste paper on each side. When the cases are in paper, they are at once applied in this manner, and the books may be said to be finished and ready for sale. Such is the mode of doing up that prodigious host of flashily covered volumes which forms a leading product of the cheap press. If the cases are in cloth, there are additional manipulations, in all of which machinery is employed.

Formerly, the ornamental and other work on the outside of books was executed in a tedious and expensive way by hand. Now, the operation, at least as regards cloth boards, is done by two or three impressions in a steam-wrought arming press; not more than half a minute being employed to do what in the olden time would have occupied a week. This improvement, the greatest in the art of book-binding, has been facilitated by an advance in the artistic skill of designers, by advancements in the art of die-sinking, and by corresponding adaptations of machinery—the whole united working towards an end.

When it is deemed necessary, for the sake of attractiveness, to stamp a peculiar device on the covers of a book, of which thousands are required, the design is referred to an artist, who, devoting himself to this branch of his profession, devises something appropriate and original. His design, drawn on paper, is cut in brass or steel; and this, in the form of a metal block, gives the stamp at a blow by the arming-press. When the design is to be gilt, leaf-gold is previously applied. The block being heated, gives a firm and clear impression. Such is the expeditious method of titling and ornamenting with blank and gold tooling the cloth-covered books that are now generally in use.

Books bound in leather, of course, go through a more slow and careful process of forwarding and finishing. Formerly, the folded sheets were beaten with a broad-faced hammer on a stone, but now they are squeezed between steel rollers, to give them the required solidity. The sewing, gluing of the back, backing singly with a hammer, and the other manipulations which follow, are all effected with great deliberation and nicety; and in this department of binding the highest class of operatives are employed. At one time, the titling of bound books was executed letter by letter, and comparatively few men had sufficient skill and steadiness of hand to produce good work. Now, lettering is sometimes done by means of metal types put together in a small case; though, when numbers are to be executed, the title is cut in block. It is usual also to apply stamps in block to the sides of bound books, and to leave only the finer and smaller tooling to be done by hand. Yet, although greatly assisted by new mechanical contrivances, the finisher must needs be a kind of artist. Coming to his hands flat and solid, and with its joints well formed, through the previous care of the forwarder, he delivers the book a perfect work of art. It opens easily, and lies flat out without any strain; its hinges are finely formed without crease; and on back, edges, and sides, the tooling claims mathematical precision.

A method of fixing together the leaves of a book by means of caoutchouc, or India rubber, instead of by sewing, has been invented. The sheets are cut into leaves, and the back edges, being laid evenly, receive a solution of this tenacious material. As each leaf is held merely by the caoutchouc which adheres to it, the book can be made to lie very flat; but this new kind of binding is only employed for maps, or books of plates, and does not seem likely to come into general use. Another novelty in binding is the substitution of wood for pasteboard boards, in imitation of books of ancient date. Applied only to some costly books of a fanciful kind, this must be considered to be but a passing caprice; for as wood is liable to warp, it can never serve so well as pasteboards.

In the present day, the binding-trade is pursued in various distinct branches. There are binders who devote themselves entirely to doing up books in cloth or paper; others execute general binding in leather; a third class bind only account-books; a fourth confine their workmanship to Bibles and prayer-books; and a fifth are known as binders of books in a high style of art. A common defect in provincial binding is a want of taste. Strength is given without elegance; even in the finest kind of books, there is often a vulgarity as regards the colors of the end papers, and the marbling of the edges, as if the binders were unconscious of proper delicacy of effect. The same thing may almost be said of the best American binding.

Among celebrated English binders of a past age, the foremost place is usually assigned to Roger Payne, a clever but wayward being who carried on business in the W. end of London about the year 1770, and who, from his unfortunate habits, died in great poverty. His reputation as a binder rests principally on his fine tooling and choice of ornaments, in which department he introduced many improvements. The greatest of Payne's successors was Charles Lewis, a London binder (1786–1836), whose talent, according to Dr. Dibdin, "consists in uniting the taste of Roger Payne with a freedom of forwarding and squareness of finishing peculiarly his own. His books appear to move on silken hinges; his joints are beautifully squared, and wrought upon with studded gold; and in his inside decorations he stands without a compeer." At present, there are several eminent binders in London, whose forwarding and finishing, as well as artistic decoration, have given them a deservedly high reputation. W. C.

BOOK-CLUB, or BOOK-SOCIETY, an association of individuals for purchasing and reading new books as they issue from the press, which, after being circulated among the members, are sold for the benefit of the concern. In some cases, the used books are disposed of by auction among the members. Book-clubs exist in many of the large towns and rural districts of Great Britain. Although new in name, and mostly composed of persons in the higher ranks of life, they are established on plans similar to the more humble class of reading societies which were common in different parts of the country in the latter part of the 18th century. In some places, the more fashionable book-clubs have been superseded by the late re-invigoration of the system of circulating libraries (q.v.). W. C.

BOOK-KEEPING is the method of recording business transactions in a set of blank-paper books kept for the purpose, by all classes of traders, as well as in various kinds of establishments. Viewed as an art, book-keeping was first brought to comparative perfection by the merchants of Genoa and other cities in the n. of Italy; and followed up by the merchants of the Netherlands, it has been brought to England, in which

country, as also in the British colonial possessions and the United States, it is now carried on in the best manner by professional accountants and skilled clerks in counting-houses. The books employed are usually of a folio size, strongly bound. For security against loss, it is customary to remove them every night from the desk and ordinary shelves in the counting-house to a fire-proof safe.

Although reduced to an accurate system, the details of book-keeping necessarily differ according to the extent and the nature of the transactions to be recorded. In all kinds of book-keeping, however, there are or ought to be certain pervading principles, to which we shall in a brief way refer. The object is to keep an account of the goods a trader buys and sells, and the money he receives and pays away; also to show, at short and periodic intervals, the exact state of his affairs—what are his *assets* (property and sums of money owing to him), and what are his *liabilities* (debts owing by him, and other pecuniary obligations). On the proper accomplishment of this object may be said to depend the stability and the reputation of the trader. Such is obviously the case, for, unless a person keep an accurate set of books to enable him to ascertain how his affairs stand, he must in a great measure be proceeding upon vague, and possibly erroneous conclusions; the result of which may be insolvency or bankruptcy, and loss of good name. In many instances, bankruptcy is traced to no other cause than the keeping of an insufficient set of books, and even keeping these badly. Viewed as credentials, a merchant's books are invested with a certain sacredness of character. Such a set of them is to be kept as will at all times admit of a satisfactory statement of affairs being made up. On this account, they require to be kept with great neatness, accuracy, and perspicuity. As a rule, there should be no blotting, no scraping out of words or figures, and no tearing out of leaves—the records are to be beyond suspicion of falsification.

Single Entry.—The simpler kind of accounting is called book-keeping by single entry; the principal books used being the day-book, invoice-book, cash-book, and bill-book, which are employed for recording the transactions as they occur, and a ledger, to which the entries are afterwards transferred, under the names of the parties concerned. The method is called single entry, for the reason that the items are entered only once in the accounts in the ledger.

Day-book.—The purpose of this book is to keep a daily account of all goods sold on credit—that is, goods not paid for at the time of being bought. The book is ruled with a date-line on the left-hand side of the page, and with double money-lines at the right-hand side. The entry of a transaction comprehends the name of the purchaser, and beneath it a note of the articles sold, with the prices extended to the first money-column. The gross amount added up is extended to the second money-column; so that the amount of all sales may easily be summed up. After the name of the purchaser, it is usual to put *Dr.*, and to articles in the entry is prefixed *To*—the meaning of these insertions being that the party named is *debtor* to the concern for the articles mentioned.

Invoice-book.—This book, which is similarly ruled, is sometimes called the *credit day-book*. It is used for keeping an account of all goods bought on credit. When the goods are bought, an invoice, or account of them, accompanies the package, or is received by post, and on being checked off, the items are copied into the book. After the name of the seller of the goods is inscribed the contraction *Cr.*, and to the items entered is prefixed the word *By*—the meaning of which is, that the party named is *creditor by* having sold the articles named. For the sake of brivity, some dealers merely enter the name of the creditor, the date, and the amount; and preserve the invoices, by docketing and tying them up in parcels, or by fastening them into a paper-book prepared for the purpose. In any case, the invoices should always be preserved.

Cash-book.—In this is kept an account of all cash received and paid, and of discount received and allowed. It is ruled for date and double money-columns on each page. Two pages, one opposite the other, are required for the entries; that on the left hand for entering cash received, and the discount allowed *by* the trader; that on the right hand for the cash he pays, and the discount allowed *to* him. The first money-column on each page is for the discount, and the second for the cash. For example, if a person settles his account, amounting to £5, less a discount of 5*s.*, the sum of 5*s.* is entered in the first column, and £4, 15*s.* in the second; by which means a record is kept of accounts settled and the money actually received. A similar explanation applies to the "cash paid" side. At the close of business for the day, the amounts on both sides are summed up and balanced.

Bill-book.—This contains an account of all "bills receivable"—that is, bills of which the trader is to receive payment; and "bills payable"—that is, bills which he has to pay. Sometimes, however, in the case of large concerns, these two classes of bills have each a distinct book. The books are ruled in a particular manner, to admit of an explicit statement of dates, amounts, length of term, and other particulars. See article Bills.

Ledger.—This is the great book of the concern. It comprehends an abstract of the entries in the day-book, invoice-book, cash-book, and bill-book, the whole collected in a methodic form under the names of the various persons, whether standing in the relation of debtors or creditors to the trader; and not only so, but an account of the trader's own private debit and credit. Two sets of colums are assigned to every person's account, one for *Dr.*, and the other for *Cr.* The copying of items from the day-book, etc., into these

ledger accounts, is termed posting. According to the ordinary practice, books are posted after short and regular intervals—not longer than a month. Having books at all times well-posted up is an acknowledged mark of a good man of business. By means of a well-posted ledger, and an inventory of stock and other assets, drawn up with a prudent regard to realizable value, the trader is able at the end of a year to make a *balance-sheet*, or condensed statement of his affairs. A proper balance-sheet ought to show the amount of capital invested in the form of money, stock, debts, etc.; also the amount of liabilities, the expenses at which the business has been conducted, the money drawn on private account, and the profit that is over, after all deductions have been made.

Some other books of a subsidiary kind are kept by large trading houses—as an *order-book*, in which copies of all orders are entered: a *memorandum-book;* an *account sales-book*, from which particulars are obtained for making out accounts of the sales of goods which may have been sent for disposal on commission; a *stock-book*, in which an inventory is kept of the stock on hand; an *account-book*, to contain a list of accounts; a *ware-house-book*, to contain an account of the quantities of goods; a *letter-book*, into which letters sent out by the firm are copied; with some others.

With such a set of books, and a few additional memoranda, a trader could doubtless strike a balance at the end of the year. He could see how much was owing to him, how much he was owing to others, how much he had spent, and how much would remain over, or how much would be deficient, after all accounts *pro* and *con* were settled. But by this elementary routine he could establish no satisfactory check on different departments of his business; and for large and complicated concerns, the system, if not absolutely valueless, would prove exceedingly imperfect. What the wholesale trader wants is a process of checks—one book checking another—the whole thing reduced to such a rigorously methodized system of entries that every fraction is thoroughly accounted for. No doubt, to effect this elaborate and minute system of B., a considerable expense is incurred for clerks; but in large establishments this is of small account in comparison with the advantages that are secured.

Double Entry.—The method of B., which has been so called, is only an extension of that already noticed. The distinct peculiarity in double entry chiefly concerns the ledger. Its object is a system of checks, to be effected by entering transactions in the ledger twice—first to the *debtor* of one set of accounts, and then to the *creditor* of another set. In making the two entries, one is posted to an account under the name of the debtor or creditor, and the other is posted to an account under the head of the goods that have been bought or sold. Take, for instance, the article sugar. Say the trader purchases a hogshead of the article from A. Brown & Co. He first enters it in the regular way to the *Cr.* of A. Brown & Co., and then turning to the folio headed "sugar," he enters it on the *Dr.* side of the account as bought from A. Brown & Co. In the same way, when the hogshead is sold to E. Fraser & Co., it is entered first to the *Dr.* of these parties, and then to the *Cr.* side of sugar as sold to E. Fraser & Co. By this system of double entries, one the counterpart of the other, the one set of accounts constantly checks the other set; a trader can also ascertain how, when, and at what prices his property has been disposed of.

In double entry, a book called a *journal* is frequently used. The entries in the day-book, etc., are abstracted into the journal, and thence posted in a brief form into the ledger; the use of the journal, therefore, is only to save the ledger from being burdened with details.

Acknowledged to be the triumph of accountantship, B. by double entry, or by the Italian method, as it is sometimes called, is not an entire safeguard against frauds and fallacies in the conducting of commercial operations, which, independently of every technical aid, requires to be sustained by constant integrity, vigilance, and discretion. Among the fallacies in the method of keeping books which are observed to sap the stability of the most gigantic concerns, are two so conspicuous as to demand our notice. The first consists in including bad or nearly worthless debts in the periodical lists of assets. The second is that of not estimating stock at its realizable value only. This last may be said to be a common error among traders, many of whom, without any evil intention, and simply from want of prudent consideration in making due allowance for depreciation of property, delusively and gradually slip into a condition of hopeless insolvency.

B. forms a department of school education in connection with penmanship and arithmetic. There are various useful treatises on the subject, with forms for day-book, ledger and other books. Among the larger and more comprehensive of this class of works are *A Complete System of Book-keeping*, by Benjamin Booth (Lond. 4to), Jones' *Science of Book-keeping Exemplified* (Lond. 4to); *Practical Book-keeping*, by F. H. Carter, (Edin.). Among the lesser and more accessible treatises we may specify *Book-keeping by Single and Double Entry*, by W. Inglis (Edin.). It is proper, however, to add, that no method of school instruction can supercede the practieal knowledge which is to be procured only in a busy and well-conducted counting-house. W. C.

BOOK-STALLS. See Book-trade.

BOOK-TRADE, the business of dealing in books, in which are comprehended two classes of persons—publishers, who prepare and dispose of books wholesale; and book-

sellers, to whom the retailing of books more properly belongs. Although ordinarily distinct, the two professions may conveniently be treated together. While publishing, apart from bookselling, is of modern date, the selling of books is as old as the origin of literature. Copies of the works of authors in manuscript were sold in the cities of ancient Greece and Rome. Horace celebrates "the brothers Sosii" as eminent booksellers (*bibliopolæ*). With the foundation of several universities in the 12th c., the preparation and sale of books increased; but the trade of bookselling attained to importance only after the invention of printing. The first printers acted also as booksellers, and being mostly learned men, they were generally the editors, and, in some instances, the authors of the works which they produced. See PRINTING. Faust and Schæffer, the partners of Gutenberg (q.v.), carried the productions of the Mainz press to the fair of Frankfurt-on-the-Maine and to Paris. Some instances of division of the two branches, printing and bookselling, occurred in the 15th century. John Rynmann of Augsburg (1497–1522) styled himself, at the conclusion of his publications, "Archibibliopola of Germany." In consequence of the Reformation, the seats of learning were gradually removed from the southern to the northern states of Germany, and, of course, the booksellers followed their customers.

Migrating from place to place, and also resorting to the great continental fairs for customers, the early booksellers became known as *stationarii*, or stationers, from the practice of stationing themselves at stalls or booths in the streets, as is still customary with dealers in old books. The term stationer was long held to be synonymous with bookseller, but in modern times it is more commonly applied to dealers in paper and other writing materials.

Whether settled or migratory, the early publishers and sellers of books were subject to a number of restrictions, as is still the case in France and Russia. In England, the book-trade was trammeled by royal patents and proclamations, decrees and ordinances of the star chamber, licenses of universities, and charters granting monopolies in the sale of particular classes of works. In 1556, in the reign of Mary, the stationers' company of London was constituted by royal charter, the professed aim being the "removal of great and detestable heresies." The members of the company were made literary constables to search for books, etc., and it was ordered "that no man should exercise the mystery of printing, unless he was of the stationers' company, or had a license." The charter, which was confirmed by Elizabeth in 1559–60, in effect empowered the company to make ordinances as to the printing and sale of books, and to exercise an arbitrary censorship of the press. The Crown, by an act 13 and 14 Car. II. c. 23, commonly called the "licensing act," assumed this species of control over the issue of books. The licensing act, and its renewals, ultimately expired in 1694. By the first copyright act, 8 Anne, c. 19, the legislature interposed to protect the rights of authors, and to relieve them, as well as publishers, from the thraldom of the stationers' company. But, by the same act, the archbishop of Canterbury, the lord chancellor, and certain judges in England, and the judges of the court of session in Scotland, were empowered, on the complaint of any person, to regulate the prices of books, and to fine those who sought higher prices than they enjoined. This provision was in force till 1738, when it was abolished by the act 12 Geo. II. c. 36. From this time the book-trade was free. How it spread and flourished may be best learned from the history of the literature with which it is identified. Subsequent to the reigns of Anne and George I., there was a succession of men of literary repute connected with the metropolitan book-trade; among whom may be mentioned Cave, the conductor and publisher of the *Gentleman's Magazine*, and early patron of Samuel Johnson; Dodsley, a poet and dramatist, who reached the head of the bookselling profession; and three generations of the Nicholses. We might also include Richardson the novelist, a printer, who, in 1754, became master of the stationers' company. The names of Baldwin, Rivington, Longman, Tonson, Miller, Cadell, Dilley, Lackington, and others, will also be as familiar as are the Knights, Bohns, and Murrays of later times.

Now, as formerly, the book-trade is centered in London, though carried on to a considerable extent in Edinburgh, and in a less degree in Oxford, Cambridge, Dublin, Glasgow, and a few other places. There are various reasons for London being the metropolis of English literature. As a center of wealth, taste, and intellect, authors flock towards it as an agreeable and permanent home, and find in the library of the British museum the most ample materials for reference and study. By means of its system of railways, and its port, assorted parcels of books can be conveniently despatched to all parts of the United Kingdom, and of the world. It has numerous wholesale stationers, and abounds in printers, bookbinders, artists, and wood-engravers. Stationers' hall, in which the rights to literary property may be inscribed, is situated in London. Through its channels of literary intelligence and criticism, it possesses the most ample means of making new works known. Through favor of these circumstances, the metropolis becomes the center of the British book-trade; almost every new work floats towards it, either for publication or to be issued wholesale on commission. In 1878, there were connected with the book-trade, within the bounds of the post-office district, 296 booksellers who were also publishers, and 446 booksellers alone. Of these, about 18 confined their business almost exclusively to the sale of foreign books, and 15 to the publication and sale of law-books. Among the booksellers are included com-

mission-houses; and among the publishing establishments are several branches from Edinburgh and other places. The London book-trade is partly carried on in distinct departments; miscellaneous literature, law books, medical books, educational treatises, periodicals, etc., respectively engage the attention of publishers; and as regards religious books, each sect may be said to have publishers and booksellers of its own. The greater number of the publishing and commission houses are situated in Paternoster row and the courts adjoining; so that this part of the city has become the great and acknowledged market for literature. In whatever part of the metropolis books are primarily issued, they may be found in one of the establishments in or about "the Row," by which means the collecting of books to meet country or foreign orders is effected at once on the spot. Every commission-house has "collectors," who, with bags, are seen hurrying about, picking up the works which are entered in their collecting-book. When not so found, books are said to be "out of print."

In Scotland, after struggling through an age of similar restrictions, the book-trade was developed about the middle of the 18th century. In Edinburgh, it was followed by Allan Ramsay, who published and sold his own songs, and his still more charming pastoral. Among his successors were Donaldson, Bell, Elliot, and Creech, each eminent in his way; more lately, the trade was ably sustained by Archibald Constable, the first publisher of the *Edinburgh Review* and *Waverley Novels;* and by William Blackwood, the originator of *Blackwood's Magazine;* still more recently the reputation of the Edinburgh book-trade was maintained by the late Adam Black, publisher of the *Encyclopædia Britannica*, and who, besides rising to the highest civic honors, became member of parliament for his native city, on the retirement of Mr. (afterwards lord) Macaulay (1855).

Considering the many advantages possessed by London, it may appear surprising that the business of publishing should be attempted to any extent in Edinburgh—the only place out of the metropolis to which we need specially refer. Yet, the Scottish capital is not devoid of recommendations. Its general society is of a character to invite the residence of men of literary acquirements, and it is fortunate in possessing an extensive collection of books for reference in the library of the Faculty of Advocates. Edinburgh publishers are able to conduct their enterprises with a degree of calmness and deliberation which can scarcely be realized in London; while, at the same time, they enjoy a certain advantage in comparatively cheap labor. Paper also may be obtained at a somewhat lower price from Scotch makers than from the wholesale stationers of London—this last circumstance being of first importance in producing large impressions of cheap books and periodicals. As Edinburgh books are mostly sent to London, the expense of carriage and loss by commission form a drawback on profits. Notwithstanding this and other disadvantages, the book-trade of Edinburgh continues in a thriving condition. It comprehends upwards of 30 firms carrying on the united business of publishers and booksellers, and 90 who carry on business as booksellers alone. In this list are several leading publishing houses, which print the works that they issue, an economical and convenient union of professions which forms a peculiar feature of the Edinburgh book trade. In the establishment whence the present work is issued, every department connected with the preparation and dispersion of books is included.

The publishers and booksellers of the United Kingdom possess no corporate privileges, nor do they associate for any professional object. No premiums are offered to stimulate improvements in typography, binding, or anything else—the trade being entirely free, members being left to rise through individual exertion. All members of the profession, however, constitute, what is, *par excellence* "the trade," through which there is a pervading and strong feeling of fellowship.

In the infancy of the trade, authors frequently resorted to the plan of getting friends and patrons to subscribe for copies of their forthcoming works; the publisher in such cases acting only as commission-agent. Dryden's translation of Virgil's *Æneid* was sold in this way. There were, in the case of that work, two classes of subscribers, one paying five, the other two, guineas for a copy. Those who paid the larger sum obtained the additional value, by individually receiving a dedication plate with their arms underneath. There were 101 of the first class of subscribers, and 250 of the second. Pope made a fortune by his *subscription* books. He realized upwards of £5000 from his translation of Homer's *Iliad*, and £3000 from that of the *Odyssey*, both sold by subscription. Johnson, who lived in the transition state between the old and new way of disposing of literary works, perceived that the subscription system was essentially an unsound one, and that booksellers formed a proper and necessary medium between authors and the public. "He that asks for subscriptions soon finds that he has enemies. All who do not encourage him defame him." And again: "Now learning is a trade; a man goes to a bookseller and gets what he can. We have done with patronage." Literature has now risen above this degrading system. At present, (1) the author sells his work in manuscript to the publisher for a specified sum, giving him an assignment of the copyright, and leaving him to bring out the work according to his own fancy; or (2) the author retains the copyright, pays all expenses, undertakes all risks, and gets a publisher to bring out his work; or (3) the author, retaining the copyright, incurs no risk, and only allows the publisher to print and issue an edition of a certain number of copies for a sum agreed on; or (4) the author and publisher issue the work at their joint risk, and on such other terms as are mutually agreeable. In some instances, the publisher will not

undertake to issue a work, unless the author gets it printed, and delivers copies ready for sale; in others, he will relieve the author of this trouble, and risking outlay, keep an account of charges and sales. Any plan by which an author retains a risk, is seldom satisfactory. Publishing is an exceedingly hazardous profession. Works of which the highest expectations are formed, may not pay expenses; and books of a very frivolous and seemingly worthless kind may prove exceedingly remunerative. From a general misapprehension on this point, publishers have frequently been maligned as unjustly living on the brains of authors, who are ever represented as an unfortunate and ill-used race. A knowledge of the hazardous nature of publishing, and of the heavy expenditure ordinarily incurred for making new books known, not to speak of the unreasonable expectations which are sometimes formed by literary men, would do much to dispel the common notions on the subject. For one book that is highly successful, there are numbers that become a dead stock in the warehouse, and barely pay expenses, of which melancholy fact too many authors who undertake the expenses and the risks of publication must be well aware, from dear-bought experience. But with writers of really popular and successful works, English publishers usually deal in a most liberal spirit; numerous instances, indeed, could be cited in which they have voluntarily and largely added to the remuneration stipulated to be given for copyright. For the celebrated sermon, *Religion in Common Life*, preached before the queen by the Rev. John Caird (1855), though only a shilling pamphlet, the publishers, Messrs. Blackwood, of Edinburgh, gave £100; but the sale having gone far beyond expectations, they afterwards, of their own accord, presented the author with an additional sum of £400. Facts like this, while reflecting honor on the book-trade, show the baselessness of the imputations so inconsiderately cast on publishers as a body.

In publishing new books, the following are the items of outlay which need to be taken into account: Copyright, paper, setting up the types, author's corrections, stereotyping, press-work or printing, embellishments, binding, advertising, presentation copies to editors for review, and to public institutions in terms of the copyright act. When the author retains the copyright, the publisher charges, besides the above items for printing, etc., a commission on the sales of the work. New books are issued at a certain selling price to the public, and the publisher allows a percentage off the price to the retail bookseller. In a large proportion of cases, there is interposed the commission-agent. Several London publishers have commission-agents in the principal towns, to whom they consign quantities of each work to be sold to the retail dealers; and in the same way, provincial publishers having agents in London, it happens that the book-trade is largely and necessarily carried on through middlemen. These individuals, of course, receive a commission adequate to remunerate them, after giving the ordinary publisher's allowance to the retailer.

It is usual, on issuing new books, for publishers or their agents to send out the work to be "subscribed" among the trade. A copy of the new work is shown by way of sample, and the subscription paper bears the selling price, and the price at which copies are offered. Besides making the trade acquainted with the day of publication of works which have been some time expected, this practice offers an opportunity for speculating. As an encouragement to do so, the work is offered at a somewhat lower rate than is afterwards allowed. By subscribing for books in this manner, and also by means of "trade sales," commission houses in the Row ordinarily put themselves in possession of the works issued by publishers in other parts of London.

Trade sales, which are now less common than formerly, are conducted in the following manner. A publisher, wishing to dispose of his stock, issues a catalogue to the trade, stating the reduced price of each book, as well as the length of credit offered; and that the sale is to take place in a tavern specified, on a certain day for which an invitation is given. At the appointed time and place, a handsome dinner is on the table, and perhaps from eighty to one hundred and fifty guests are assembled. Nothing is said about business during dinner, but with the wine and glasses afterwards, and amidst no little good-humor, the sale begins. Each book being called over, every person has an opportunity of saying how many copies he will take. Occasionally, a toast is proposed, in order to maintain the hilarity of the meeting.

At these sales, it is not unusual to dispose of "remainders of books," that is, fag-ends of editions which are not moving off with sufficient alacrity in the ordinary course of trade. Remainders are either offered in small quantities at a very reduced price, or they are sold in the lump by auction. Purchased cheaply, these remainders are henceforth known as "books with broken prices." Many of the new-looking books ticketed at cheap booksellers are portions of these remainders. In some instances they are sent to the colonies, in the hope of finding a market. At these trade sales it is common to do business to the extent of from £5000 to £10,000; in the case of one publishing house, the amount is usually, at a half-yearly sale, from £12,000 to £15,000; and in another, being an annual sale, it is seldom less than £26,000. To avoid the seemingly useless outlay on a dinner, some publishers rely on the circulation of "sale catalogues," comprising offers at tempting prices, provided that orders are given within a certain day. Vast quantities of school-books of good reputation, and other works permanently in demand, are bought by London commission-houses in this manner annually.

Throughout the more respectable part of the trade, there is a constant effort to main-

tain unbroken prices; but when a book can be obtained by booksellers below trade-price, it is essentially ruined for all regular business. On the other hand, there has sprung up a practice amongst some retail booksellers of selling new books to the public at prices little above cost. This system of underselling has caused much disquietude in the trade. For a long time, resolute attempts were made by the heads of the profession to refuse to deal with undersellers; but these, appealing to the public, ultimately conquered; and now books of all kinds are disposed of at such prices as the bookseller pleases. In one sense, this underselling is unjust to the publisher, who has his wares sold cheap, without the *éclat* and solid benefit which he might derive from fixing on them such low prices as would induce a large sale. Whether publishers will in time fall on the expedient of lowering nominal selling-prices, at the same time lessening allowances, or whether they will altogether drop the marking of prices, are questions on which we need not enter. Enough has been said to show that, after making all ordinary deductions, to which losses, etc., may be added, publishers can reckon on receiving little more than half the price at which their books are nominally issued. To limit impressions as nearly as possible to the demand, is always a matter of serious consideration to the publisher; for, unlike most other kinds of goods left on hand, the overplus stocks of books are often nearly valueless. On this account, books are seldom sent out on sale or return except to commission-agents.

In one important respect the English publisher differs from the producer of almost every other class of goods. He has not only to manufacture the article, but to make it known to the public. While the retail draper takes upon himself the trouble and cost of advertising his novelties in order to attract customers, the retail bookseller is relieved from any such obligation, and has little else to do than to hand across the counter the book for which a demand has been stimulated by the costly efforts of the publisher. The grand difficulty with the publisher is to excite general attention to his wares. Hence, the stupendous advertising system in newspapers and other channels of intelligence Some publishers are reported to spend as much as £5000 per annum on advertisements, and an expenditure of from £1000 to £2000 is quite common. The monthly and quarterly periodicals being important advertising channels, it is of consequence to publishers to possess one of these, both for the sake of the revenue it may produce, and for keeping their own books before the public. A well-circulated periodical, therefore, is to be viewed as almost a necessity in the business of the publisher—the thing which gives spring and vitality to what might be otherwise an inert and difficult concern. So grave a matter is advertising to the publisher, that it is very generally the practice to employ one or more clerks to write, arrange, and distribute advertisements, and to conduct the multifarious correspondence connected with them. In consequence of these burdensome outlays, and other causes, including the liberal distribution of copies of books for review, the prices affixed to original works are necessarily higher than the actual amount of paper and print would seem to warrant. Books, as has been said, are subscribed for among the booksellers of the principal cities; but booksellers in the country towns either send for supplies by letter, or give their orders to travelers employed by the chief houses. Between the country booksellers and the leading publishers in London, Edinburgh, or Dublin, there is kept up a continual correspondence. In addition to his daily or weekly parcel, every provincial bookseller makes up a monthly order for magazines, periodicals, and books; and the collecting for monthly parcels forms one of the remarkable phenomena of the Row. The day of making up, called "magazine day," is the last, or last but one, of the month, when periodicals for the succeeding month are collected and dispatched. In receiving and forwarding of inclosures by these monthly parcels, there prevails a spirit of mutual accommodation, which is exceedingly commendable, and without which, indeed, a large portion of the book-trade would be at a stand. By means of inclosures, booksellers in the most distant parts of the country are able to procure small supplies from different publishers at a trifling charge for carriage—with what result of convenience to the public need not be dwelt upon. The execution of foreign orders, is, of course, comprehended in the business of the publisher. Publishers formerly took but little account of the demand likely to arise for their books from abroad, but now they frequently print an extra number of copies for export to the United States, Canada, and Australia. Previous to the internecine war in the United States, American publishers were in the constant habit of seizing upon popular English copyright books, and reprinting them in a cheap form suitable for their own market, which included Canada and several other British colonies. As nothing was paid to the author, books so printed were sold at prices against which the English publisher found it impossible to compete; he therefore withdrew in disgust, and left the colonnial market to be supplied with "pirated editions." The protective system in vogue in the United States largely assists in maintaining the high cost of production in America, of books as well as other things. This, in connection with the greater literary fecundity of the old country, enables a large export trade in books to be done with the Americans. The Canada copyright act, too (38 and 39 Vict., c. 88), provides for the republishing or reprinting of English books in Canada; so that, notwithstanding the absence of any international copyright treaty, it is probable that in the course of a few years most modern English books read in any part of America will be such as are either printed here, or are reprinted there by arrangement with the English publisher or author.

The plan of issuing neat cheap editions of popular works, was struck out a hundred years ago (1760–70) by Alexander Donaldson, an Edinburgh bookseller above referred to,* and was followed up by several publishers in London, one of whom, C. Cooke, of Paternoster row (1790–1800), issued an extensive series of cheap reprints, of a pocket size, called *Cooke's Editions*, which for tastefulness of preparation have never been excelled. In the early years of the present century, Suttaby's, Sharpe's, Walker's, and Dove's pocket editions, were stock articles in the trade. About 1817–18 some enterprising booksellers began to break through certain old usages of the trade, by issuing reprints of standard works, in a good style of typography, at considerably reduced prices. At the same time, numerous cheap periodicals made their appearance; but these, for the most part, were of so seditious, irreligious, and libellous a character, that the law interposed to check the growing evil, by the act 60 Geo. III., and 1 Geo. IV. c. 9. See NEWSPAPERS. Those cheap unstamped periodicals which appeared during the next ten years, were only tolerated when, eschewing news and politics, they confined themselves strictly to matters of instruction or amusement. The only one that attained to permanent success was the *Mirror*, an illustrated weekly sheet, 8vo size, projected by John Limbird in London, the first number of which appeared Nov. 22, 1822. When, therefore, in 1827, the society for Diffusing Useful Knowledge began to issue its low-priced scientific treatises—and when, in the same year, Archibald Constable commenced the cheap series of works in original literature, called *Constable's Miscellany*—the public were already in some measure familiar with a certain class of cheap books. Yet, viewing all previous enterprises of this kind as fitful and insufficient, as well as unsupported by any breadth of appreciation, we have to refer to this period (1827–32) for the true origin of what is now designated the "cheap press." Constable's attempt to cheapen literature was happily coincident with a general awakening in the public mind, and proved eminently successful; imitations followed; a variety of serial works, in small volumes, for popular use made their appearance. A similar popularizing of the price of periodicals was the next step in advance. Several cheap sheets of an entertaining nature were issued, similar to Limbird's *Mirror*, though more resembling a newspaper in shape, but for various reasons most of them soon disappeared. At this juncture, taking advantage of the growing demand for cheap literature, and desirous of guiding it in a right direction, William and Robert Chambers, of Edinburgh, began, on the 4th of Feb., 1832, to issue *Chambers' Edinburgh Journal*, a weekly sheet at 1½*d.*; on the 31st of Mar. following appeared in London the *Penny Magazine* of the society for the Diffusion of Useful Knowledge; and July 7th, this was followed by the *Saturday Magazine*, which was issued under the direction of a committee of the society for Promoting Christian Knowledge. So many cheap publications of various kinds followed, that it would be impossible to particularize them in this brief sketch. The efforts to establish a cheap press were much facilitated by two great inventions—the paper making machine and the printing-machine, both of which had been introduced within the preceding twenty years. The continued issue of cheap reprints of popular works out of copyright has greatly changed the aspect of the trade; and although works at old prices are as numerous as ever, cheap books of an improving tendency are now placed within general reach. By the enterprise of certain publishers, new and copyright works are also now issued in a cheap form, in boards, with colored paper covers—the prices of these neat and handy volumes being from 1*s.* to 2*s.* 6*d.* each. The trade in this class of books, and in cheap periodicals and newspapers, has been largely developed by railways. On the platforms

* According to the act, 8 Anne, c. 19, the copyright of a book was for 14 years, with a second term of 14 years contingent on the author being alive at the expiration of the first term. While such was the law, publishers who bought a copyright were usually allowed, by courtesy of the trade, to continue to publish their works unmolested during the second term, even if the author was dead when the first term expired. Notwithstanding this act there was long so little precision as to questions of literary property, that works issued by London publishers were freely reprinted in Edinburgh, while those belonging to Edinburgh publishers were similarly dealt with in London—for example, *Ramsay's Poems*, which were issued by the author at Edinburgh in 1725, were reprinted in London, and also in Dublin, in 1731. Alexander Donaldson, of Edinburgh, is said to have taken the lead in this kind of trade, though from any evidence on the subject, it does not appear that he went beyond the bounds of the law. In order to extend his sale of cheap reprints, he opened a shop in the Strand: a step which brought him into collision with certain publishers in London. It will be recollected that Boswell, in his Life of Johnson, under date 1763, alludes to this case of Donaldson, who is spoken of by Johnson as "a fellow who takes advantage of the state of the law to injure his brethren"—one who, supposing he did reduce the price of books, "is no better than Robin Hood, who robbed the rich in order to give to the poor." To judge from the litigation which ensued, Donaldson scarcely merited these strictures. In 1771, certain parties in London procured an injunction from the court of chancery to restrain Alexander Donaldson from printing and selling *Thomson's Seasons*, on the ground that it was their property. Donaldson, appealing to the house of lords, showed that the work in question was first printed in 1729, that its author died in 1748, and that the copyright expired in 1757. The lords decided in favor of Donaldson; thereby settling the point, that copyright depended entirely on the statute, and was not an inherent and interminable right of property, as many seem to have believed it to have been. Some details of this curious and important case will be found in the article COPYRIGHT. Donaldson, whose enterprises are spoken of approvingly by Boswell, left a fortune, which was greatly augmented by his son, a newspaper publisher in Edinburgh; and the total sum, amounting to nearly a quarter of a million sterling, was bequeathed to found an educational hospital for poor children. This building adorns the environs of Edinburgh, and is one of the most magnificent in Scotland. See DONALDSON'S HOSPITAL. This is not the only hospital for which the world is indebted to the book-trade. Thomas Guy, a bookseller in Cornhill, London, founded during his life the hospital which bears his name; he died in 1724. See GUY'S HOSPITAL.

of all the chief termini and stations, there are stalls for the sale of books, periodicals, and newspapers. These stalls, consisting of a counter and some shelving, which can be closed in with shutters at night, are rented from the railway companies by different booksellers, from whose head establishments supplies ceaselessly radiate. One firm, in Aug., 1878, had 645 stalls. A London publisher was recently able to announce that in the twelve months preceding he had printed five millions of book.

The sudden and successful rise of a cheap press was not viewed with complacency by the fathers of the trade, and for a long time it was believed that, like many other novelties, it would have its day, and disappear. Looked at, therefore, as temporary and undignified, the cheap press was left to force its way in the hands of two or three ardent young publishers, who, extending their operations, at length assumed a position which could not fail to command respect, and to excite a spirit of emulation. Latterly, the old established firms have begun, though in a hesitating way, to issue a cheap class of publications, by reprinting and otherwise. At the same time, these firms, besides generally maintaining the old prices, unite to keep a few editions of standard works in print. These "trade editions," as they are termed, are printed and supplied in shares; each party concerned taking an interest in their sale, and being so far precluded from attempting the issue of rival editions. The names of all the proprietors of these joint-stock books are printed on the title-page; but as no new books are added, this once popular method of publication will soon become extinct.

As circulating libraries, by creating a taste for reading, led to the establishment of the cheap press, so, as might be expected, has the cheap press extended the sphere of literature, and given rise to public libraries and book-clubs; and even circulating libraries, which for a time suffered from the deluge of minor publications, have begun not only to revive, but to assume dimensions beyond precedent. Mr. Mudie, in the year 1842, introduced a new system of subscription lending library, which in 1873 contained a million volumes, employing 80 clerks, and having no fewer than 18,000 subscribers to the London establishment alone. As many as 2000 copies of a single work at 18s. or a guinea are sometimes added; so that in many cases what would formerly have been considered to be large editions are absorbed by one purchaser. After being used for several months, the overplus copies belonging to these libraries are disposed of at from a half to one quarter of the original price; and the readiness with which they find customers among the lesser libraries throughout the country is alone an evidence of the increasing demand for books. Mudie's library now contains more than 2,000,000 volumes, having absorbed the largest of the older circulating libraries, which was said to contain half a million volumes.

The selling of second-hand books from open stalls, and from booths (q.v.), is a practice so ancient as to be connected with the trade of the stationarii of the middle ages. Some men of considerable note in the book-trade began in the humble quality of stall-keepers. The most celebrated instance of this kind is perhaps that of James Lackington. He commenced his remarkable career by keeping a small stall of old books, which, while working as a shoe-maker, he placed at his door in one of the obscure streets of the metropolis; and from his ultimate success, was able to inscribe the proud boast, *Sutor ultra crepidam feliciter ausus*, on his very entertaining memoirs. Though more common formerly than now, book-stalls are still seen in every large European city. They particularly abound in Paris—chiefly on the quays near the Pont Neuf; and at all the great continental fairs, stalls of new and second-hand books are conspicuous. Book-sellers at one time took their place among the stall-keepers on market-days in English provincial towns, nor have they altogether disappeared. Michael Johnson, book-seller in Lichfield, was in the habit of setting up a stall for the sale of his wares, every market-day, in Uttoxeter. On one occasion, confined to bed by indisposition, he requested his son Samuel to visit the market, and attend the stall in his place, which he refused to do. How this act of criminal pride and filial disobedience preyed in after-years on the mind of the great lexicographer; and how, in his old age, to expiate this juvenile delinquency, he went to Uttoxeter on a market-day, and stood on the site of his father's stall for the space of an hour bare-headed in the rain, exposed to the jeers of the by-standers, are among the most characteristic circumstances narrated in the life of this extraordinary man (see Boswell, Crocker's post 8vo edition, vol. x., p. 103). The flood of cheap publications 40 years ago, which has been already referred to, greatly damaged the stall-trade in old books. Nevertheless, there remained in London a few book-stalls and booths, and in Edinburgh, though fallen from their high estate, book-stalls are still visible. In Paris the stall-trade still flourishes, and no book-hunter in that city loses the opportunity of a ramble along the quays. It must be admitted, however, that the business is losing its picturesque character; it is getting into a regular shop-trade, and attaining to dimensions far beyond the notions of the old class of stall-keepers. London, of course, is the chief seat of the second-hand book-trade; but it is also conducted on a respectable scale in Edinburgh, Glasgow, Manchester, Liverpool, Oxford, Cambridge, Dublin, Bristol, and some other centers of wealth and intelligence. The dealers procure supplies chiefly at public auctions of the libraries of deceased clergymen, professors, and private gentlemen, of which sales there is a constant succession in London, Edinburgh, and elsewhere. At these auctions, good editions of standard books may usually be obtained at moderate prices; but rare and curious works, prized by the "bibliomaniac," frequently

bring very high sums. See BIBLIOMANIA. Dealers in second-hand books send catalogues to their customers throughout the country; and from this source not a few gentlemen's libraries are mainly made up. During the past 20 years, there has been a growing scarcity of second-hand high-class works, in consequence of the purchase of large quantities for public libraries forming in the United States. From France, Italy, and Germany, there has been a similar export-trade in splendid old editions to North America.

At one period, it was usual to limit editions to from 500 to 1000 or 1250 copies, and impressions of 2000 were considered excessive. Now, large editions are more frequently the rule than the exception, particularly as regards the works of standard authors published in a cheap form. As the cost of composition (setting the types) is the same for a large as for a small edition, and as the charge for press-work is only a little more for a larger than a smaller impression, the profit on a book rises rapidly in proportion as the quantity put to press increases. In the case of cheap books, it is absolutely necessary that large impressions be sold, in order that they may realize any profit to the publisher. In preparing this class of books, therefore, to the extent of from 20,000 to 50,000 impressions, the element of composition dwindles into insignificance. The chief things taken into account are paper, machine-printing, and boarding. Paper, however, being the matter of most serious concern, the weight is rigorously computed beforehand by putting a sample volume into the scales. To avoid delay, and also to save outlay in preparing future impressions, it is customary to stereotype cheap books and periodicals. Although, like composition, stereotyping forms a minor charge, the accumulation of stereotype-plates at length becomes considerable, and, as in the case of overplus stock, forms a burden on the capital of the publisher.

The changes produced in the English book-trade by the cheap press are not more remarkable than that improvement in taste which has subdued the traffic in books of a politically objectionable, and of a demoralizing character. Contrary to fears entertained on the subject, the cheapening of books, periodicals, and newspapers has in no perceptible degree deteriorated literature. The sale of books of a grossly demoralizing tendency has been driven into obscurity, and in other ways circumscribed by an act of parliament (21 and 22 Vict., c. 83); and it is demonstrable, as regards periodicals, that those of an objectionable kind form but a small proportion—not one hundredth part of the whole. Little dependence can be placed upon the statements given of the circulation of weekly and monthly magazines, as there is a general disinclination on the part of respectable publishers to state their actual sales; while the numbers mentioned by the less reputable members of the trade are almost without exception fictitious, and are generally mentioned for the sole purpose of attracting advertisements. Cases have been brought before our notice in which hundreds have been magnified into thousands, and in very rare instances indeed is the *bona-fide* circulation honestly stated. The aggregate monthly circulation of periodicals of all descriptions, excluding newspapers, may be stated at about 10,000,000, of which not more than 90,000 are actually immoral or anti-religious. The circulation of some of the religious magazines is very large; of two published at sixpence monthly by the religious tract society, one sells to the extent of 160,000, and the other 85,000. Including newspapers, the total number of separate weekly and monthly publications issued in London is nearly 800.

Obviously, the sale of such an enormous mass of cheap sheets would be overwhelming to the ordinary trade; in point of fact, the writing and publishing, and also the retailing, of the more widely circulated penny papers are conducted as a separate business. The sales are effected chiefly by means of small shops in back-streets, the purchasers being, besides domestic servants, all varieties of persons, old and young, who reside in these humble localities. The rise of these cheap periodical and newspaper shops, in adaptation to new social wants, is not the least remarkable of the "signs of the times." Nor can it be spoken of with regret. With other commodities the huxter dispenses the weekly pennyworth of literary amusement, which, enjoyed in the poorest family circle, enlivens the most dreary fate, and if not directly elevating in its tendency, may be presumed to do at least some good as a substitute for more exceptionable means of excitement. On general grounds there is cause for congratulation. Considering the preponderatingly large proportion of cheap periodicals of an unobjectionable, and not uninstructive kind, and looking also at the perfect freedom now enjoyed by every department of the press, we have a striking illustration of the vastly improved state of public feeling, with which cheap literature has steadily kept pace, since the reign of George IV. Not even in the most objectionable of the irreligious prints is there anything at all resembling the scurrilities which were at one time prevalent. The classes of books and periodicals which a number of years ago consisted of coarsely offensive attacks on the government, church, laws, etc., have entirely disappeared, and and at no time in its whole history has the book-trade of Great Britain been on a more healthy footing than it is at present.

Limited by the generally imperfect state of education and inaptitude for reading, the ordinary book-trade is also obstructed on account of large sections of the people still speaking some form of the Celtic language, and being unable to understand English. The Scottish Highlanders, Welsh, Manx, and aboriginal Irish, are less or more in this condition. In Wales, there exists a press specially devoted to those who, in remote

parts of the principality, still hold to the ancient vernacular; and the publishing of books and periodicals in the native tongue is conducted with remarkable activity. Some are translations from English works of a useful and popular kind, occasionally illustrated with wood-engravings; and the circumstance of there being a taste and demand for such productions affords a favorable view of the intellectual advancement of the principality. In Ireland, on the contrary, almost the only works printed in the ancient tongue are for the use of scholars, and not, as in Wales, for the poor. The Highlands and Western islands of Scotland produce no literature, native or translated; and the Gaelic books in the hands of the people are extremely limited in variety and number.

Entirely separated from the general book-trade, there flourishes a system of publishing of a peculiar kind. We allude to the *canvassing trade*, which consists in the plan of disposing of books mostly in weekly and monthly numbers or parts. The business is conducted by only a few houses in London, Edinburgh, Glasgow, and one or two other places. Canvassers are employed to go from door to door, to procure subscribers; and the numbers are delivered periodically till the work is completed. On account of the expense of canvassing and delivery, books sold in this manner are necessarily much dearer than if disposed of through the ordinary channels of trade. The method, however, of buying books in small portions at a time, accommodates certain classes of customers, and has been the means of disseminating an improving literature—bibles, with notes and illustrations, and works of piety in particular—in quarters not reached by the operations of the bookseller. During the past twenty years, the canvassing trade has largely been engaged in selling books, and especially bibles, in the complete form. On giving an order, the book or bible is left, and a small sum paid, and a similar sum weekly or monthly. It is said that but few bad debts are made amongst working-men, a fact that speaks well for their honesty.

Apart, likewise, from the general trade, the publication of small books, tracts, and periodicals is carried on to a large extent by associations for religious purposes, the funds for which are raised by voluntary subscriptions. As far as concerns the distribution of purely religious tracts among the unfortunate and less instructed members of the community, no fault is found with the operations of these societies. But when such associations address themselves to the publication of volumes and illustrated periodicals, differing in no material respect from the ordinary products of private enterprise, and intended not for gratuitous distribution, but for sale, a certain injury is felt to be unbecomingly inflicted on the trade, which can no more be justified than the damage done to free competition by the giving of bounties on particular manufactures. Notice has been taken of two periodicals of the religious tract society of London, the circulation of which must be allowed to be fostered in this manner, and other works could be pointed out as being so greatly cheapened by the same objectionable method as to be placed completely beyond the reach of fair commercial competition. See RELIGIOUS TRACT SOCIETY.

Another distinct kind of trade is that of printing and publishing authorized versions of the Bible, New Testament, and Book of Common Prayer. The preparation of these works has always been a prerogative of the crown, which grants exclusive privileges or patent-rights to certain parties for the purpose. From old usage, England, Ireland, and Scotland are treated separately. The last patent for England was granted by George IV. to Andrew Strahan, George Eyre, and Andrew Spottiswoode, for a term of thirty years; and having commenced on the 21st Jan., 1830, it expired on the 21st Jan., 1860, and was then renewed during pleasure. The universities of Oxford and Cambridge have enjoyed the right of printing Bibles, etc., in common with the patentees; but in their case it is a simple affair of permission, they have no power to prohibit or prosecute. See PATENT.

In Ireland, George III., in 1766, granted a Bible patent to Boulton Grierson for forty years. He was succeeded by his son, George Grierson, who, in 1811, obtained a renewal. Trinity college, Dublin, had also a concurrent right; but the English patentees, and both Oxford and Cambridge, are permitted to import their Bibles into Ireland.

In Scotland, the last patent expired in 1839, and was not renewed in consequence of remonstrances from that country, to the effect that if its printing were left free, the Bible would be sold at a considerably lower price than it had hitherto been. Such has proved to be the case. The crown appoints a board with authority to grant licenses to parties desirous to print editions of the Bible and other books falling within the royal prerogative, such as the Confession of Faith of the Church of Scotland, but the importation of English printed editions is not prohibited. (See *Abridgment of Specifications relating to Printing, etc., printed by order of the Commissioners of Patents*, London, 1859.)

The modification of the patent having tended to lower prices, the possibility of any further material reduction seems doubtful. One noticeable feature of the trade in Bibles is, that the publishers in England sell large numbers in sheets. They are bought by bookbinders, who do them up in various styles; some very neatly with gilt edges, which they sell to retailers at about 11*d.* per copy. Other copies, costing, perhaps, not more than 1*s.* or 1*s.* 6*d.* in sheets, are bound in velvet, morocco, tortoise-shell, or other ornamental bindings, and retailed as high as three guineas each. It is computed that in London alone, nearly 1000 persons are employed in binding Bibles, Prayer-books, and other books of devotion. From their cheapness, but more particularly from their accuracy,

English-printed Bibles and New Testaments are purchased in large quantities by the United States. Other large purchasers are the British and Foreign Bible Society. The Society for Promoting Christian Knowledge makes large purchases of Prayer-books and church services in addition.

Although the printing of the authorized version of the Bible, the New Testament, and the Book of Common Prayer, with as well as without notes, seems to be reserved to the nominees of the crown, practically no objection is taken to the printing of these works by others, nor has any objection ever been raised to those printed with notes and comments. Many such editions are accordingly prepared and issued by publishers, often in a style of great elegance. Translations of the Bible, other than the authorized version, are also issued freely by Roman Catholic and other bodies; and at the present time a committee of learned divines is engaged upon a revised version of the English Bible, the copyright of which has been secured by the universities of Oxford and Cambridge, although the revision will not be completed for some years.

The universities of Oxford and Cambridge; also of Trinity college, Dublin; the four Scotch universities; and the colleges of Eton, Winchester, and Westminster, were so much alarmed by the decision of the house of lords in 1772, in favor of Donaldson's right to reprint works not protected by the copyright law of 8 Anne, c. 19, that they applied for and obtained an act of parliament, 15 Geo. III. c. 53, giving them a perpetual copyright of all works belonging to them, or which might afterwards be bequeathed to or acquired by them. The only work in existence older than the present century, claimed by any of the above institutions, to which any value can be attached, is Clarendon's *History of the Rebellion*, with his life and continuation. The right to this and other works possessed by the university of Oxford, was confirmed by the last copyright act, 5 and 6 Vict. c. 45. It will therefore be understood that the printing and publishing of lord Clarendon's *History of the Rebellion* remains an absolute and perpetual monopoly in the university of Oxford—a curious exemption from the ordinary and terminable claim of copyright, and singularly at variance with modern notions of free-trade. It should be added that the profits of the first edition were very great, and were applied by the university towards the erection of the "Clarendon press," which was for a long time the university press; but, its business increasing, the "Clarendon" has been superseded by the "university printing-house;" the former building, a very handsome one, being used for other purposes. (Besides Godson's *Law of Patents and Copyrights*, and *Supplements*, see Dr. Ingram's *Memorials of Public Buildings of Oxford*, new edition, 1848, p. 11.)

Publishers are under the legal obligation to deliver, free, a copy of every book they issue (new editions without alterations excepted) to the five following public institutions: Library of the British museum; Bodleian library, Oxford; university library, Cambridge; Trinity college library, Dublin; and library of Faculty of Advocates, Edinburgh. This obligation, imposed by a clause in the copyright act (see COPYRIGHT), is usually spoken of as an unjustifiable burden, and no doubt it is so; but it is chiefly from causing trouble that it becomes matter for complaint. In comparison with the immense benefits conferred on literature by the public libraries mentioned, the value of the books (with some exceptions) claimed by them is insignificant. In practice, not a hundredth part of the cheap books and sheets issued are given or claimed; which is perhaps unimportant, for if they were, no ordinary building could contain them.

The English book-trade has been lately much indebted to certain liberal post-office arrangements. Manuscripts, proof-sheets, books, periodicals, and catalogues, if left open at the ends, may now be transmitted by post at an exceedingly small charge. See POST-OFFICE.

Unitedly the whole trade of publishing and book-selling forms an important staple of national industry—inferior to some other manufactures and trades, yet great when viewed in relation to its past history, and to the still imperfect state of education among large masses of the people, and respectable from the number of men of high character who are connected with it. In reckoning the number of new works issued from the press annually, we may take the number of entries of distinct books, volumes, sheets, maps, etc., lodged by publishers at the British museum, in terms of the copyright act. The following is an abstract of the return for 1878: Books—complete works, 9456; parts of volumes, works in progress, and periodicals, 26,826; single articles, including play-bills, songs, broadsides, etc., 10,228—total 46,517. Music—complete works, volumes, and pieces, 4369. Maps—350, in 1533 sheets.; atlases, 29. Twenty years ago the number was only about half as great. In 1877, about 5000 new books and new editions were published. In 1876, the books imported into the United Kingdom were valued at £150,099. Of these the value from Germany was £30,568; France, £46,919; Holland, £25,288; the United States, £18,473; and Spain, £6564. The value of English printed books exported in 1876 was £881,839. The United States purchased to the amount of £191,966; Australia, £334,136; Canada, £68,102; British India, £85,269; France, Germany, Holland, and Belgium, unitedly, took to the value of £93,887; our next largest customer being s. Africa, for £40,007. In 1874, the value of books exported was £904,792; of imports, £178,936. It is seen that the exports are five or six fold more than the imports; also that we export to Australia alone more than twice as much as we import from all countries, and to the United States almost a third more than our total imports.

A system of more free and untaxed import of foreign-printed English works would, in various ways, introduce changes into the book-trade, and have a tendency to alter some of its traditional usages.

In Germany, where printing originated, the book-trade became also first established, and the principal mart was Frankfort, to the fairs of which the early book-sellers and printers resorted. Leipsic also became a great mart for books as early as 1680; yet this ancient city is only one of many places of book preparation in Germany. Among them Stuttgart has taken a front rank, since about 1830, as an agency place for the s. German book-trade, whilst Frankfort has now entirely lost its ancient prestige. Throughout the different states of the German empire, more particularly Prussia and Saxony, printing and publishing are largely carried on; and from the various places of publication a great proportion of entire editions of works is transferred to Leipsic agents, who disperse the books throughout Germany, and all those countries for the book-trade of which the city of Leipsic forms the nucleus. Hence arises the important peculiarity of German literature, that literary, artistic, and scientific activity is not limited to or monopolized by any single city, and that, consequently, authors do not need to resort to a metropolis for encouragement or any professional labor. Formerly the book-sellers from the various parts of Germany, and those countries which are dependent, in some measure, upon Germany, on account of affinity of language and identity of aspirations—such as Holland, Belgium, Denmark, Sweden, Norway, etc.—used to meet at Leipsic twice a year, at Easter, and Michaelmas, with a view to exchange their respective publications, and arrange for settlement of mutual accounts. At present, business is done at Leipsic through a system of agencies by commissioners there established. Every book-seller in Germany and the adjacent countries has his commissioner at Leipsic, and to him he forwards packages containing copies of his new publication or publications, on sale or return, for all the book-sellers with whom he has an account. The commissioner then distributes the packages among the Leipsic commissioners, every one of whom is thus enabled, out of the many packages flowing in every week, to make up a case for each of his correspondents. At the end of the year, unsold books are returned to the various senders by means of the Leipsic agency. At Easter, during the fair, the balances are now mostly paid by commissioner to commissioner, the German publishers not resorting as much as formerly to the fair; the extension of railway communication, and other circumstances facilitating business, having somewhat changed the nature of the trade. The method of sending parcels of new works, on sale or return, may not be satisfactory according to English notions, but the advantages of the plan are obvious in various points of view. There is no country in the world where literary and scientific novelties are so regularly made known and become noticed as in Germany. Let the book be what it may, within six weeks after its first publication it is known all over Germany, and, through the personal vigilance of the retailers, is brought everywhere under the notice of those individuals to whom the subject treated of may be of interest. This method of publication has the merit of great simplicity, and secures an exemption from that frightful expenditure on advertisements to make books known, which presses on the English publisher. On this account, as well as from the cheapness of paper and printing, and the simple way that books are for the most part done up, the selling-prices of every variety of production are very moderate. The only drawback on the German publisher is the liability to heavy returns of unsold books; but this he doubtless endeavors to avert by professional tact in his speculations, and a good knowledge of the market. It is, at all events, the belief of those who are well acquainted with the German book-trade, that the method pursued not only furnishes books cheaper, but is more productive to author and publisher than that in England; and that in point of good management and prosperity it exceeds, or at least equals, the book-trade in any other country. From the teeming press of baron Bernhard Tauchnitz of Leipsic has been issued a series of 1760 volumes of cheap reprints of English popular works in a pocket size, which are sold largely in Germany and all other continental countries. It is proper, however, to say that, as there is an international copyright law between Germany and the United Kingdom, these *Tauchnitz editions*, as they are termed, are issued in virtue of an honorable arrangement with English publishers and authors, and are accordingly not to be ranked with the piratical issues of the New York trade. Latterly the sale of German books in England, France, and North America has rapidly increased.

In France, publishing is carried on chiefly in Paris, where there are many extensive printing establishments, including the *Imprimerie Nationale*, provided with machinery equal, if not superior, to anything of the kind in London. As regards substantiality and elegance, French books occupy a place between those of Germany and England. They are, with few exceptions, done up simply in colored paper covers, for temporary service; but the ink is generally better than that used in England; and works, when of a superior class, are executed with a high degree of taste—the excellence of pictorial embellishments being always conspicuous. Certain voluminous and most expensive works in French, and also in the classical languages, occasionally issue from the Parisian press, and command a large sale; orders of copies for university and public libraries all over the continent tending to promote these gigantic enterprises. Although confined mainly to Paris, the business of publishing, or at least of preparing books for the Parisian market, and for exportation, is carried on to a considerable extent in several provincial

towns. Tours, in particular, is the seat of a large book-factory—that of Messrs. Mame—in which printing, designing, engraving, and binding are all executed on the premises.

The French book trade was virtually suspended during the war with Germany, 1870–71, but it may now be said to have fairly recovered, if not surpassed its former condition. The exports are to Italy, Germany, Russia, Holland, Belgium, North America, and other countries, and a portion also comes to England. Between France and the United Kingdom there is now an international law of copyright, by which translations of works are, under certain limitations, protected in either country, when the title-page indicates that "the right of translation is reserved."

In the 17th c., various cities in the Dutch Netherlands bore a prominent place in the book-trade. At Amsterdam, some of the most beautiful editions of the classics, and large numbers of illustrated books, were executed: while from Leyden, and other seats of learning, exports of works in law, theology, etc., formed at one time a prosperous commerce. In this, as in other trades, it has been the fate of Holland to lose its former reputation; it now produces few books in any other language than its own: but the demand for books in the Protestant parts of the country, and the number of booksellers, is perhaps larger than in any other part of the world. That part of the Netherlands now known as Belgium possesses a flourishing book-trade, mainly, we believe, on account of French being the language generally spoken. Brussels, as a kind of minor Paris, is the seat of some extensive printing and publishing concerns; and at Malines, missals, breviaries, and other religious works are produced in large numbers. According to a return of the minister of finances of Belgium, the following was the import and export trade in books for 1872: Value of imports, 3,460,000 francs, of which 70 per cent was from France; value of exports, 3,000,000 francs, of which 40 per cent was to France, and 60 to all other countries.

In Spain, bookselling is almost defunct; even in Madrid it can scarcely be said to have an existence. In Italy, there are signs of revival, but the most active booksellers there are natives of Germany, who, during the last thirty years, have established bookselling houses in the principal cities, Rome, Naples, Turin, Milan, Bologna, Florence, Venice, and Verona, also Triest; and under their auspices the trade may be expected to assume an organized form. Already these intelligent foreigners have done much to keep alive a knowledge of Italian literature.

The book-trade of the United States, which is daily assuming greater proportions, has sprung up from small beginnings within the present century. As in Germany, the business of publishing is monopolized by no particular city, but is carried on successfully in various towns throughout the union. The chief centres are New York, Boston, and Philadelphia; but many books are published at Albany, Buffalo, Baltimore, Washington, New Orleans, Charleston, Cincinnati, Chicago, St. Louis, and San Francisco; and a few in other places. The great distributing houses are located at New York and Philadelphia; and throughout the United States and Canada there are about 6200 booksellers, two thirds of whom unite an exceedingly miscellaneous collection of trades with that of bookselling. A few of the larger publishing houses in New York and Philadelphia, like some in Edinburgh and Glasgow, print, bind, and manufacture the books they sell. Harper's building in New York, and Lippincott's in Philadelphia, each cover nearly half an acre of ground, and cost above £50,000. The annual value of books produced in the United States is unknown. In 1871, upon very uncertain data, it was estimated at $7,000,000, this amount probably being the full selling-price of every volume printed. In consequence of the protectionist policy pursued since the war, the present state of the book-trade is far from satisfactory, and will probably remain so till wiser counsels prevail. English publishers and authors are naturally indignant at the conduct of American publishers persisting in reprinting British copyright works, a practice which, though now decreasing, has been carried on to an enormous extent by the Harpers and the Appletons of New York, and others, in defiance of remonstrance, and even in disregard to the claims of those more scrupulous American publishers who pay for and import early sheets from England. The present state of matters is regretted by the more high-minded Americans as much as it is in Britain.

American books are now executed with neatness and taste; their wood-cut embellishments sometimes surpass those of London; and in point of size and price, they are, for the most part, well adapted for general circulation. On account of the prevalence of education, and also the aspiring habits of the people, book-buyers of a humble position in life are greatly more numerous than they are in the United Kingdom. Few books are purchased by the Irish emigrants, but the Germans are buyers, and many of the colored people are eager in their thirst for knowledge, and their children are all amply provided with schools. Looking on the American trade as, after all, yet but partially developed, it may be expected, in the progress of events, to go on in a vastly accelerated ratio. Latterly, several English publishers have established branches of their business in New York; and there are now some extensive American commission-houses in London—from which intercommunion happy results may be anticipated. Books are sold wholesale by written orders, trade sales, auctions, and otherwise. Country dealers are in the habit of visiting the great book dépôts of Boston, New York, and Philadelphia, and there personally making their selections. As previously stated, there is a large export of American

books to Canada and other British possessions, in which, as yet, native literature is on a poor scale, but where there is a large and increasing number of readers.

In doing up books in cloth boards, the American binders invariably cut off the outer folds of the sheets, so as to smooth the edges of the leaves, as in English leather binding; by which process, the first readers of new books are spared the trouble of cutting open the leaves. Many persons have wished to see this improvement, for such it is, introduced into England. There are still, however, prejudices to be overcome on the subject. Strange as it may appear, numbers of purchasers like to cut up the leaves with a folder as they advance through a new book or periodical, from an idea that the repeated slight interruptions heighten the pleasure of perusal. In our experience, we have known gentlemen who would not sit down to read a cut-up new book. Besides, there is a notion among buyers in England, that books with smooth-cut leaves may be second-hand, and not worth the price of new. Undoubtedly, the Americans are ahead of Europeans generally in this particular.

Notice has been taken of the constant export from Europe to the United States of quantities of high-class books to stock the great public libraries that are everywhere springing into existence through the liberality of state legislatures, or the munificence of private individuals. There is, however, a traffic of a similar kind, more especially from England, in execution of orders for second-hand books from dealers who have establishments in the principal cities in the union, and through whose agency persons of refined tastes are becoming acquainted with the aspect of our older literary treasures. One of these second-hand book-stores in Philadelphia, which we visited some years ago, was on as extensive a scale as anything of the kind in London or Edinburgh, while the choice which it presented would have come quite up to the delicate perceptions of the bibliomaniac.

For a variety of particulars bearing on book-trade in general, we refer to the articles, BIBLIOGRAPHY, BOOK, BOOKBINDING, CENSORSHIP, CIRCULATING LIBRARY, COPYRIGHT, NEWSPAPERS, PAPER, PERIODICALS, PRESS, PRINTING, STATIONER, STEREOTYPING, WOOD-ENGRAVING. W. C.

BOOK TRADE (*ante*). The book trade in the United States is of comparatively recent growth, although printing was introduced into New York as early as 1683. For scholars and libraries the needed books were imported from Europe, but with the spread of newspapers and the development of education, the increasing demand for books offered to publishers a profit from the reproduction of the best works of English literature. The oldest house in the trade is that of Sower, Potts & Co., whose founder, Christopher Saur, sr., made almanacs and German Bibles, near Philadelphia, in 1740. The book production of this country was estimated, in 1820, to amount to only $2,500,000, of which about 50 per cent were original American books; for 1830, $2,500,000, 40 per cent American; for 1840, $5,500,000, or 12,000,000 volumes, 55 per cent American; for 1850, $12,500,000, 70 per cent American; for 1856, $16,000,000, 80 per cent American. These statistics are only estimated, but it shows that the proportion of original American books has steadily increased. The production of books in 1871 was estimated at $40,000,000; 5632 American books were entered for copyright in 1878, and 6580 in 1879; during 1879, the copyright of 5265 of these was perfected by depositing copies in the library of congress as required by law. The trade is usually classified into three divisions—publishing, jobbing, and retailing; but although there are a great number of persons who sell books and periodicals in connection with some other business, there are probably not more than 3000 regular bookstores. About 900 names are given in the *American Catalogue* of those who publish occasionally, but nine tenths of the trade is carried on by about 50 publishers. The "subscription publishers" sell their books through agents and canvassers. Publishers of educational books form a special class, although some of the prominent houses, like Scribner, Appleton, and the Harpers, have educational departments in their business. The "jobber" is the middleman, who orders books in large quantities from the publisher, and distributes them among the retail booksellers throughout the country. Many of the larger houses, like Lippincot, combine the business of the publisher, jobber, and retailer; while others, like Houghton, Mifflin & Co., confine themselves to the sale of their own publications. Every spring and fall there is a "trade sale" in New York, at which large numbers of new publications and standard books are sold to the highest bidders among the jobbers and retailers represented at the sales. The American publishers generally allow the retailers from 25 to 40 per cent, and the jobbers 5 per cent more. The usual forms for books published in this country are 12mo for novels, books of poetry, etc., and 8vo for books of travel, treatises, etc. It is customary among publishers to allow the author of a book a "copyright" payment of 10 per cent on the retail price for all sales; but a gross sum is frequently paid to the author, and the book then becomes the sole property of the publisher. The copyright of a book is granted for 28 years, with the privilege of renewal, by the author, his widow, or children, for 14 years more. A copy of the title-page must be registered in the office of the librarian of congress at Washington before publication, and two copies of the best edition must be sent to the same office within 10 days after publication. The fees are 50 cts. for recording entry, and 50 cts. for each copy of record; there is no other expense. This fee does not, as in the case of patents, cover any investigation into the validity of the copyright, the librarian of congress being only a registering and in no sense a judicial officer. The

most noteworthy attempt to supply the American book-trade with a bibliography was made in the *Bibliotheca Americana* of Roorbach, a catalogue of publications including American issues from 1820, continued by Kelly, in supplements, to 1871; this is now superseded, for current books, by the *American Catalogue*, issued under the direction of F. Leypoldt, containing entries of all books (including imported editions) in print and for sale in this country July 1, 1876. The first volume, now issued, includes the alphabet by authors and titles, covering about 70,000 entries; the second, in preparation, gives the same books under subject-entries. The trade periodicals are the *Publishers' Weekly*, New York, which was begun as the *Weekly Trade Circular* in 1872, by F. Leypoldt, and which afterwards absorbed Child's *Publishers' Circular*, founded in 1852; and the *American Bookseller*, published fortnightly by the American News Co. The *Publishers' Weekly* is especially valuable for its weekly record of current publications, giving full titles, prices, and other information, entered in accordance with the cataloguing system of the American literary association, and furnished with appended descriptive notes, giving briefly the scope, character, and contents of the books. The *American Bookseller*, besides records of new books, includes monthly a useful index, classified by subjects, of the prominent articles in the periodicals of the month.

BOOLAK, or BOULAC, a t. of Egypt, on the right bank of the Nile, 2 or 3 m. n. of Cairo, of which it forms the port. Destroyed by the French in 1799, it was rebuilt by Mehemet Ali, who established cotton, silk, and weaving factories; a government printing-house, from which a newspaper in Arabic is issued weekly; and a school of engineering. It is connected by railways with Alexandria and Suez. Pop. 20,000.

BOOLE, GEORGE, LL.D., 1815-64; an English logician and mathematician. He passed an uneventful life, first as principal of a school at Lincoln, afterwards at Waddington, and as professor of mathematics in Queen's college, Cork. He completed two systematic treatises on mathematical subjects, one on *Differential Equations*, and the other on *Finite Differences*, a sequel to the first. Both soon became standard text-books. B. is also noted in logic for his work, *An Investigation of the Laws of Thought, on which are founded the Mathematical Theories of Logic and Probabilities*. In 1844, he received the royal medal.

BOOLUNDSCHU'HUR, a British district in the lieutenant-governorship of the North-west Provinces of India. With an area of 1910 sq.m., it contained, in 1872, 936,593 inhabitants. It lies in n. lat., between 28° 3′ to 28° 43′, and in e. long. between 77° 28′ to 78° 32′, being bounded to the n. and w. respectively by the districts of Meerut and Delhi. Its chief town of the same name, otherwise called Unchuganj, is on the route between Bareilly and Delhi, being 40 m. to the s.e. of the latter. Its pop. amounts to 14,804; and its distance from Calcutta is 780 miles, its elevation above the level of the sea being almost precisely the same number of feet.

BOOM, in a ship, is a general name for the long poles which jut out from certain supports or uprights, to stretch or extend the bottoms of sails. Some taper regularly from the middle towards both ends; while others have the thickest part at about one-third of the length from one end. According to their particular modes and places of application, they receive the names of *jib B.*, *flying jib B.*, *studding-sail B.*, *lower studding-sail B.*, *main B.*, *square-sail B.*, *driver B.*, *spanker B.*, *ring-tail B.*, *maintopmast B.*, *foretopmast B.*, *fire B.*, etc. In the old 110-gun ships of Nelson's days, these booms varied from 57 to 32 ft. in length, and from 15 to 6 in. in thickness. The war-steamers of the present day require a somewhat different equipment of booms. The immense spread of canvas in some of the clipper merchant-ships now built requires the use of booms of very considerable length. A seaman speaks of "booming" when he applies a B. to a sail; he employs *B. irons*, shaped like the figure 8, to connect booms and other spars together end to end.

Besides the booms on board ship, the same name is also given to a strong iron chain employed in barring the passage of the mouth of a harbor or river, or to cut off the retreat of an enemy if he has actually entered. Such a B. should be protected by a battery or batteries. The chains are moored, and are floated by logs. There should be two such chains, one to afford resistance if the enemy has penetrated the other; they need not extend all across the passage, seeing that shallow spots are self-defended. A modern war-steamer would cut through a chain B., unless made of very thick and strong iron. Sometimes hempen cable booms are used to resist small-craft. The Russians effectually boomed the harbor of Sebastopol, in Sept., 1854, thereby preventing the entrance of English and French ships; this was done partly by sinking some of their own ships, and partly by the laying of booms.

BOOM, a t. of Belg'um, in the province of Antwerp, about 10 m. s. of the city of that name. Its situation at the junction of the Brussels canal with the river Rupel makes it a place of considerable trade. It has numerous and extensive brick and tile works, breweries, tanneries, rope-walks, sail-cloth manufactures, salt-works, etc. Pop. 7464.

BOOMERANG, a missile instrument for war, sport, or the chase, in use by the aborigines of Australia. It is of hard wood, of a bent form; the shape is parabolic. It is about 2 and a half in. broad, a third of an inch thick, and 2 ft. long, the extrem-

ities being rounded. One side is flat, the other rounded; and it is brought to a bluntish edge. The method of using this remarkable weapon consists in throwing it in a particular manner. It is taken by one end, with the bulged side downwards, and the convex edge forward, and thrown directly onward, as if to hit some one thirty yards in advance. Instead of going directly forward, as might be expected, and there falling to the ground, it slowly ascends in the air, whirling round and round, and describing a curved line of progress till it reaches a considerable height, when it begins to retrograde, and finally it sweeps over the head of the projector, and falls behind him. This surprising motion is produced by the bulged side of the missile. The air impinging thereon, lifts the instrument in the air, exactly as by hitting the oblique bars in a windmill, it forces it to go round. The ingenuity of the contrivance, which is worthy of the highest scientific calculation, is very extraordinary as coming from almost the lowest race of mankind. The B. is one of the ancient instruments of war of the natives of Australia. They are said to be very dexterous in hitting birds with it, the animals being of course behind them, and perhaps not aware that they are objects of attack. This curiosity, as it must be called, was first made known by being brought before the royal Irish academy by prof. M'Cullagh in May, 1837.

BOONE, a co. of Arkansas, on the Missouri border; 576 sq.m.; pop. '80, 7,046—48 colored. The land is fertile, producing grain and dairy articles. Fine variegated marble is found. Co. seat, Harrison.

BOONE, a co. in Illinois, on the Wisconsin border; traversed by the Chicago and Northwestern railroad; 270 sq.m.; pop. '70, 12,942; '80, 11,527. It comprises rolling prairie land and forests; producing wheat, corn, rye, oats, barley, potatoes, hay, butter, cheese, and wool. Co. seat, Belvidere.

BOONE, a co. in central Indiana, intersected by the Indianapolis, Cincinnati and Lafayette railroad; 408 sq.m.; pop. '70, 22,593. It is level, with deep and fertile soil, producing grain, potatoes, wool, sorghum, molasses, etc. Co. seat, Lebanon.

BOONE, a co. in central Iowa, on the Des Moines and Snake rivers; traversed by the Iowa division of the Chicago and Northwestern railroad; 576 sq.m.; pop. '70, 14,584. It has productive soil, with abundance of coal. Co. seat, Boonesboro.

BOONE, a co. in Kentucky, on the Ohio river; traversed by the Louisville, Cincinnati and Lexington railroad; 300 sq.m.; pop. '70, 10,696—1012 colored. It has a hilly surface and fertile soil, producing grain, tobacco, and dairy articles. Co. seat, Burlington.

BOONE, a co. in n.e. Missouri, on the Missouri river; 648 sq.m.; pop. '80, 25,444—5,036 colored; surface, prairie and forest; soil productive; stone, coal and limestone are found. Co. seat, Columbia. A branch railroad connects the county seat with the St. Louis, Kansas City and Northern railroad.

BOONE, a co. in e. Nebraska, a part of which is in the Pawnee reservation; 600 sq m.; organized since the census of 1870. Pop. '76, 1,099. Co. seat, Albion.

BOONE, a co. in s.w. West Virginia; 550 sq.m.; pop. '70, 4,553—153 colored; hilly and mainly wooded. Co. seat, Madison court house.

BOONE, DANIEL, a famous backwoodsman and trapper, was born in Virginia, United States. At an early period of his life, he emigrated to North Carolina; but his love of the wilderness not being sufficiently gratified there, he planned an expedition into Kentucky, then almost unknown. On the 7th of June, 1769, along with five companions, he reached the Red river, n. of the Kentucky. B., however, was captured by the Indians, but escaped, and accidentally falling in with his brother, who had pursued his track, they lived together in a cabin during the whole winter. In May, 1770, B.'s brother went home, and B. himself was left alone in the perilous forest. In July, his brother returned, and after exploring a considerable portion of country, they returned in 1771 to Carolina, determined to emigrate with their families to Kentucky; but the attempt proved unsuccessful. Shortly after, B. was engaged as the agent of a Carolina company, in purchasing the lands on the s. side of the Kentucky river, where, in 1775, he built a fort on the site now occupied by the town of Boonesborough. In 1777, the place was twice attacked by a swarm of Indians, who, however, failed to capture it. On the 8th of Aug., 1778, a third attempt was made by 450 savages, officered by Canadian Frenchmen. In spite of repeated assaults, the little garrison of fifty men set at defiance its enemies, who were at length obliged to retire, and never afterwards ventured to besiege the place. After many skirmishes and encounters with the Indians, B. removed in 1798 to Upper Louisiana, where the Spanish authorities gave him a grant of 2000 acres of land. He settled with his children and followers at Charette, on the Missouri river, beyond the inhabited limits of the country, where he followed his favorite occupation of hunting and trapping bears till his death, which occurred in 1822. B. was one of the most adventurous of all those "pioneers of civilization" to whose courage, endurance, and skill America owes so much.

BOONE, WILLIAM JONES, D.D., b. South Carolina, 1813; d. China, 1864; first missionary bishop of the Protestant Episcopal church; a graduate at South Carolina college. He went into law practice, but left it for the ministry, and also studied medicine and

took his degree. In 1837 he went with his wife as missionary to China, and speedily mastered the difficult language. In 1843 he returned to the United States and was consecrated missionary bishop for China in 1844. He returned to China the next year and continued his labors. He came home twice for the benefit of his health, returning finally in Dec., 1859, to look after the new mission in Japan.

BOONES'BOROUGH, one of at least thirty localities in the United States, which take their name from the first pioneer of the great valley of the Mississippi. It stands on the Kentucky, about 18 m. to the s.e. of Lexington. Though now an insignificant village, yet it deserves a prominent place in the history of the mighty West. It was founded in 1775 by Daniel Boone (q.v.), as his first fort; and within three or four years thereafter, it was the seat of the first legislature beyond the Alleghanies.

BOONEVILLE, a city in Cooper co., Mo., on the Missouri river, 43 m. n.w. of Jefferson city, in the midst of a fine agricultural and mining region. It is the main market-place for s.w. Missouri and a portion of Arkansas and the Indian territory, at the terminus of the Booneville branch of the Missouri Pacific railroad, where the Missouri, Kansas and Texas railroad crosses the Missouri river. Pop. 3,506.

BOONTON, a t. in New Jersey noted for iron works; on a branch of the Morris and Essex railroad, and the Rockaway river, 40 m. n.w. of New York, in a rough mountain region. The iron works cover 60 acres, and all branches of the manufacture are carried on. The ore is magnetic, and yields from 50 to 75 per cent of metal. There are blast furnaces, rolling-mills, nut and bolt factories, and a mill for making nail kegs, of which 300,000 are used in a year. The motive power is furnished by the river and the Morris canal. The first nail mill in the country was built in old Boonetown in 1770. The old village was destroyed early in the present century by the breaking of the dam across the river.

BOORGHAS'. See BURGAS.

BOORHANPOOR', or BURHAUNPOOR, a t. in India, once the capital of Candeish, 210 m. e. of Surat; pop. 200,000. It is on a high bank of the Taptee river, surrounded by a rampart of brick, and has in the center a palace of brick known as the Red Fort, built by Akbar, who adorned the town with marble halls, a mosque, and gardens, now nearly in ruins. Trade is monopolized by Arabs. B was founded in 1414 and was for a long time the capital of the country. It was taken in 1599 by Akbar, plundered in 1685 by the Mahrattas, taken from Delhi in 1720, occupied by the English in 1803, restored the same year, and came finally under British protection in 1844.

BOOR'LOS, or BOURLOS, a lagoon in the Nile delta, Egypt, 5 m. e. of Rosetta; 38 m. long, separated from the Mediterranean by a narrow strip of land, but communicating by a single channel.

BOO'RO, an island of the Malay archipelago, about 60 m. to the w.n.w. of Amboyna, extending between s. lat. 3° and 4°, and between e. long 126° and 127°. With an area of 2000 sq.m., it is estimated to contain from 20,000 to 100,000 inhabitants. Though it is mountainous, having Mt. Dome and Tomahoo, respectively 10,400 and 6528 ft. high, yet it is, on the whole, very fertile, its productions being rice, sago, fruits, dye-woods, and cajeput oil. At the e end of the island, the Dutch have a station named Fort Defense; but the best anchorage is on the n. side in Cajeli bay.

BOOROJIRD', or BOOROOGIRD', a t. in the province of Irak-Ajemi, Persia, situated in a fertile valley about 190 m. n.w. of Ispahan. Lat. 33° 43' n., long. 48° 45' e. It has a castle and several mosques. Pop. about 12,000, who are chiefly engaged in agricultural pursuits.

BOO'SA. See BOUSSA.

BOOT, BOOTS, or BOOTIKIN, an instrument of judicial torture, formerly used in Scotland to force confessions from persons accused of crimes, or answers from unwilling or suspected witnesses. Bishop Burnet in the *History of his Own Time*, and sir Walter Scott in his *Old Mortality*, speak of the B. as made of iron; but the rev. Thomas Morer in his *Short Account of Scotland*, written from personal observation of the country at a time when the B. was still in use, describes it as "made of four pieces of narrow boards nailed together, of a competent length for the leg, not unlike those short cases we use to guard young trees from the rabbits." One or both legs of the person to be tortured having been placed in this case, wedges were inserted between the limb and the sides of the case, and these wedges were driven down by the executioner with a mall or hammer, questions being at intervals put to the sufferer, until either he gave the desired information, or fainted away, or showed such endurance as satisfied the judges that no answer could be extorted from him. The wedges were commonly placed against the calf of the leg, but bishop Burnet says he had heard that they were sometimes placed against the shin-bone. In one case—that of a lad in Orkney, in 1596—it is recorded that they were struck home as many as 57 times. In another—that of John Fian, schoolmaster at Prestonpans, burned for sorcery in 1591—it is said that the victim "did abide so many blows that his legs were crushed and beaten together as small as might be, and the bones and flesh so bruised that the blood and marrow spurted forth in great abundance, whereby they were made unserviceable forever." "Still," it is added, "he

would not confess;" and, indeed, it is remarkable in how many cases we are told that the torture, agonizing as it was, failed in its purpose, even where the sufferer "shrieked for pain in terrible manner, so as to have moved a heart of stone." A writer of 1591, after speaking of the "pilniewinks," "pilliwinks," thumb-screws, or thumbikins (q.v.) as a "grievous torture," and of compression of the skull by a twisted cord as "a most cruel torment also," describes the B. as "the most severe and cruel pain in the world." Yet there are instances in which it was not thought enough. When the boots were first used in Scotland is not known. In a case where a deed of conveyance of land was challenged as a forgery, in 1579, two witnesses, a clergyman and a notary, both of Forfarshire, were ordered to be "put in the boots, gins, or any other torments, to urge them to declare the truth." In a letter, still preserved in the state paper office at London, sir Francis Walsingham writes to the English ambassador at Edinburgh, in 1583, that queen Elizabeth desires that father William Holt, an English jesuit then in Scotland, may be "put to the boots." The B. was subject of allusion on the English stage in 1604; in Marston's *Malcontent*, printed in that year, one of the characters is made to say: "All your empirics could never do the like cure upon the gout the rack did in England, or your Scotch boots." A young gentlewoman of Aberdeenshire was tortured by the B. in 1630. Soon afterwards, it is said to have fallen into desuetude for about 50 years. It was revived after the insurrection of the westland Covenanters in 1666, and continued to be used throughout the reigns of king Charles II., and king James II., and during the first years of king William III. "The genius of our nation," writes sir J. Lauder of Fountainhall in 1681, "looks upon the torture of the boots as a barbarous remedy, and yet of late it hath been frequently used among us." The claim of right brought forward by the Scottish convention in 1689, denounced "the use of torture, without evidence, and in ordinary crimes, as contrary to law." Notwithstanding this declaration, the B. was used at least once again. In 1690, Neville Payne, an English gentleman who was supposed to have entered Scotland on a treasonable mission, was put to the torture under a warrant superscribed by king William, and still shown in the register house at Edinburgh. The B. was applied to one leg, the thumb-screws to both hands, but without any effect, although, in the words of one of the privy-councilors, the torture, which lasted for two hours, was inflicted "with all the severity that was consistent with humanity, even into that pitch that we could not preserve life and have gone further." This is believed to be the last time that the B. was used. But it was not until Scotland had ceased to be an independent kingdom, that the British parliament enacted—by the statute 7 Anne, c. 21—that in future "no person accused of any crime in Scotland shall be subject or liable to any torture." Torture is believed not to have been used in England after 1640. It was abolished in France in 1789, and in Russia in 1801.

BOO'TAN. See BHOTAN.

BOÖ'TES, in ancient mythology, the son of Ceres and of Iasion, who, being plundered of all his possessions by his brother Pluto, invented the plow, to which he yoked two oxen, and cultivated the soil to procure subsistence for himself. As a reward for this discovery, he was translated to heaven by his mother with the plow and yoke of oxen, under the name of B., i.e., the ox-driver, which is still borne by one of the constellations. According to others, B. was the son of Lycaon and Callisto, whom his father slew, and set before Jupiter for a repast, to try his omniscience. Jupiter restored him to life, and placed him amongst the stars.

BOOTH. Throughout all Europe, in early times, trade was carried on chiefly by fairs, as indeed is still the case in some parts of it, and in many parts of Asia. The tents, huts, or other temporary or movable structures in which the traders exposed their goods for sale, were called *booths*. Though the corresponding German *bude* is generally referred to *bauen*, to build, our *booth* is traced by some to the Gaelic *both* or *bothag*, a bothy or hut; by others to the Greek *apotheke*, through the Latin *apotheca*, the Italian *boteca*, and the French *boutique*—all signifying an office, shop, store-house, or tavern. From this, its primary sense, B. gradually came to mean a fixed shop or warehouse. As towns sprang up, the yearly fair was more or less supplanted by the weekly market. The slight B. which was set up in the same spot every week, had an irresistible tendency to become substantial and permanent; and the records of the 12th and some following centuries are full of unavailing complaints against the encroachments which were in this way made upon the market-places and streets. Thus, Joceline of Brakelond chronicles the ineffectual efforts of his great and wealthy abbey, in 1192, to dislodge the burgesses of Bury St. Edmunds from the shops, sheds, and stalls which they had erected on the market-place without leave of the monks. So in the Winton *Domesday Book*, compiled in 1148, notice is taken of "houses" in Winchester which had been "stalls." So, also, Stow relates that the houses in Old Fish street, in London, "were at the first but movable boards set out on market-days to show their fish there to be sold; but procuring license to set up sheds, they grew to shops, and by little and little, to tall houses." So, again, the same chronicler tells us that "in Cheapside, from the great conduit w., were many fair and large houses, which houses in former times were but sheds or shops, with solars (that is, lofts or upper chambers) over them." So in Edinburgh the range called at first "the Boothraw," and afterwards "the Luckenbooths," arose in the very center of the High street. So, likewise, in Edinburgh and elsewhere, the trader who for years had

spread his stall under the shelter of the same buttress of the church or town-hall, began to rest a fixed wooden B. against it, gradually transforming the timber beams into lath and plaster, or even into brick or stone, until at length the basement of the stately cathedral, or *hôtel de ville*, was incrusted all over with unseemly little booths (or *krames*, as they were called in Scotland), like limpets on a rock. The B. which thus arose had often but one apartment, which opened on the street by a narrow door, and a broad unglazed window, closed at night by a wooden shutter, dividing in the middle, and hinged at top and bottom, so that the upper half formed a sort of awning, while the lower half served as a table for the display of the trader's wares. It was at this window that business was conducted, the trader standing within, the buyer without. Occasionally a flight of steps led down to a cellar under the B., which served as a store-room. In other cases, a chamber behind was the warehouse of the merchant's B., or the workshop of the craftsman's B., or the sleeping-place of either. As civilization advanced, a "solar" or chamber was raised above the B. for the dwelling-house of the trader, occasionally with a store-room in the roof, to which goods were hoisted by a crane. There is mention of a goldsmith's B., with a "solar" above it, at Perth, about 1230. Traces of the middle-age B. still remain in this country. There are many perfect examples in France, some of them believed to be of the 12th century.

BOOTHS, UNLICENSED, are, by the law of England, public nuisances, and may, upon indictment, be suppressed, and the keepers of them fined. But by the 6 and 7 Vict. c. 68, s. 23, theatrical representations in booths or shows at fairs, feasts, or customary meetings of the like kind, when allowed by the justice of the peace of the district, or other local authorities, are lawful. See THEATERS, LAWS AS TO.

BOOTH, BARTON, a celebrated actor of the 18th c., was born in 1681, his father being nearly related to Henry Booth, earl of Warrington. Having received a good education at Westminster, he was sent at the age of 17 to Cambridge university, from which he ran away to join a company of strolling-players, who were shortly after dispersed by the law. B. next performed at Bartholomew fair with such success that Betterton would have engaged him for Drury Lane had he not been afraid of offending his family by doing so. After a successful engagement in Dublin, he returned to London, and was now engaged at Drury Lane, where he appeared in 1701, and made a great "sensation." He became quite the rage among the nobility, who vied with each other in placing their carriages at his disposal; and he frequently stayed over night at Windsor, where the court was then held. His greatest character was the ghost in *Hamlet*, in which he is said never to have had an equal; and his Othello, according to Cibber, was also a very masterly performance. He died May 10, 1733.

BOOTH, EDWIN, son of Junius Brutus, b. Md., 1833; brought up to the stage by his father, making his public appearance in Boston in 1849. In 1851, he supplied his father's place as "Richard III." at the Chatham theater, New York. The next season he went to California, the Sandwich islands, and Australia (1854), returning to New York in 1857. His most important advance was in 1860, when he played Shakespearean parts at the New York Winter Garden with much success; after a visit to England in 1861, he made New York his home, and played there and in other cities as a star. In 1869, "Booth's theater" was built, where, though more and more successful as an artist, he did not succeed as a manager. For the last four or five seasons he has made brief tours through various parts of the country. He is generally regarded as the leading American tragedian, and in a few great characters he is without a rival. He is not a man of imposing bodily appearance, being rather below the medium stature; but his frame is compact, his carriage at once dignified and graceful, his eye piercing, his features grave. He is thoroughly absorbed in his part, and his voice is under such complete control as to express upon occasion any shade of feeling, sentiment, or conviction. His rendering of familiar Shakespearean passages displays a fine appreciation of their substance and of the lights and shades of manner and expression by which their full meaning may be brought out. In his private life he is greatly esteemed.

BOOTH, Sir FELIX, 1775–1850: an English distiller who gave £20,000 to assist the polar expedition of sir John Ross in 1827. His name is found in "Boothia gulf" and the isthmus of "Boothia." Ross named the whole region around the magnetic pole "Boothia Felix."

BOOTH, JOHN WILKES, son of Junius Brutus; b. Md., 1839, d. April 26, 1865. Though like his brother an actor, he did not achieve notable success. During the rebellion he was in strong sympathy with the South, and at the close of the war he and others formed a conspiracy to assassinate president Lincoln, the vice-president, and members of the cabinet. On the night of Good Friday, April 14, 1865, the president attended Ford's theater, with his wife and some personal friends. About 10 P.M., B. made his way to the door of the box, approached the president unseen, and shot him through the head. Leaping from the box upon the stage, B. exclaimed, "Sic semper tyrannis! The South is avenged!" and escaped by the stage door, where a horse was held for him. In leaping upon the stage he fractured his leg, but with an accomplice he rode 30 m. before resting. When pursuers came up with him he took refuge in a barn, where, as he refused to surrender, he was shot, and died very soon after.

BOOTH, JUNIUS BRUTUS, 1796–1852; an English actor, on his mother's side a relation of John Wilkes, the English statesman. When a boy he went into the navy, but soon left the sea for a printing-office; afterwards studied law, painting, and sculpture. He appeared on the provincial stage, Dec. 13, 1813, and in London in Oct., 1815, at the age of 19. In 1817–18, he and Edmund Kean alternated in the same characters in Drury lane theater. Soon afterwards Booth gained great celebrity in *Richard III.* and "Sir Giles Overreach;" but he was taken with a fancy for travel, and in 1821 arrived at Norfolk, Va. He spent the remainder of his life in the United States, where he was exceptionally popular, and esteemed by many critics to be the greatest tragedian of his time. Though his range of characters was not wide, the people never tired of the best of them, such as "Richard III.," "Sir Giles," "Lear," "Shylock," "Hamlet," and "Iago." In acting he sank the man in the character, and was so intensely carried away that the fencing in *Hamlet* and *Richard* became duels indeed, in which "Richmond" and "Laertes" were compelled to defend themselves in earnest. Like some other great actors, his personal habits were untrustworthy, and late in life there was always much doubt of his being in condition to appear at the places and times promised.

BOOTH, MARY LOUISE, an accomplished author and translator of numerous valuable works from the French, b. New York, April 19, 1831. Her father was descended from one of the earliest settlers, John Booth, a kinsman of sir George Booth, afterwards baron Delamere, who came from England to America about 1649. Her mother is the granddaughter of a French émigré of the revolutionary epoch. Miss Booth's literary career seemed to be foreshadowed in her infancy, as she read Plutarch at five, and Racine in the original at seven; and special care, therefore, was given to her education. At an early age she became a contributor of sketches and translations to various journals; she compiled the *Marble Worker's Manual*, and the *Clock and Watch Maker's Manual;* and devoted herself to the preparation of the first complete *History of the City of New York*, which was published in 1859, a second edition in 1867, and a third edition, revised and brought down to date, in 1880. This work has been extended and illustrated by well-known book collectors. One copy enlarged to folio size, and extended to nine large volumes by the addition of many thousand illustrations, maps, and pictures, is the property of a New York citizen, and is said to be the richest collection of New Yorkiana extant. Another copy with two thousand illustrations is owned by the author, and still another copy has been extended to twenty two volumes by a gentleman of Chicago. Miss Booth has translated many works from the French, notable among which are Méry's *André Chénier*, Victor Cousin's *Life and Times of Madame de Chevreuse*, Marmier's *Russian Tales*, About's *Germaine* and *The King of the Mountains*, Pascal's *Letters*, Sue's *Mysteries of the People*, etc. In 1861, the civil war broke out, and Miss Booth, who was an ardent republican, devoted her pen to the task of interpreting to her countrymen the words of their friends in Europe. She translated in rapid succession count Agénor de Gasparin's *Uprising of a Great People* and *America before Europe*, Edouard Laboulaye's *Paris in America*, and Augustin Cochin's *Results of Emancipation* and *Results of Slavery*, which Charles Sumner declared worth a whole phalanx in the cause of freedom, and in acknowledgment of which she received letters of thanks from president Lincoln and many prominent statesmen of the day. She also translated *Vesper*, *Camille*, and *Human Sorrows* by the countess de Gasparin, and *Happiness* by the count de Gasparin, and maintained during the whole war a constant correspondence with Gasparin, Cochin, Laboulaye, Henri Martin, Montalembert, and other sympathizers with the government, who continually sent documents which she translated and published as a labor of love, in pamphlet form, through the Union League club, in the city journals, and elsewhere. She next turned her attention to Henri Martin's great *History of France*, in seventeen volumes, six of which she translated, but only four of which were published, the encouragement not warranting the continuance of the work. She has since translated Laboulaye's *Fairy Book*, Macé's *Fairy Tales*, and her abridgement of Martin's *History of France* is now in course of publication. In 1867, Miss Booth assumed the sole editorial charge of *Harper's Bazar*, which under her management proved a rapid success, and over which she continues to preside.

BOOTHAUK', a fortified pass of Afghanistan, 12 m. to the e. of Cabul. It runs for 5 m. between cliffs 500 ft. high, and is in some places only 50 yards wide.

BOOTHBAY, a seaport t. in Lincoln co., Me., at the mouth of Damariscotta river, 13 m. s.e. of Bath; pop. '70, 3200. It has an excellent harbor, and is connected by ferry with Bristol. Ship-building, fishing, and coasting trade employ the inhabitants.

BOOTHIA FELIX, a peninsula forming the most northerly part of the American continent. Towards the s. it is terminated by an isthmus, while to the n. it is bounded by Bellot strait (q.v.). It was discovered by sir John Ross during the most famous of his voyages, and named after his friend sir Felix Booth, being supposed at the time to reach as far n. as Barrow strait.

BOOTHIA GULF separates Boothia Felix on the w. from Cockburn island on the e., and is, in fact, a continuation of Prince Regent's inlet towards the south.

BOOTON, an island near the s.e. of Celebes, between 4° 25′ and 5° 45′ s. lat., and in 123° 4′ e. long. Area, 1807 miles. It is mountainous and thickly wooded, produces fine

timber, rice, maize, sago, etc. There are buffalo, swine, horses, and goats. The people are Malays. The chief town, Booton, is walled, and there fine cottons and other stuffs are made. The sultan is in alliance with the Dutch. Pop. 17,000.

BOOTS, which are only a lengthened variety of shoes, are among the most ancient articles of attire. Shoes, extended a certain height up the leg, laced, ornamented, and of fanciful colors, were in use by the ancient Egyptians, Greeks, and Romans, as is seen by existing relics and drawings. Leaving an account of these and other varieties of shoes, as well as an account of the trade and manufacture of shoes and boots generally, to the article SHOE-TRADE, we here confine attention to a few historical particulars respecting what are properly called B., meaning by the term leather coverings for the legs and feet. Different kinds of half-boots were worn by the Anglo-Saxons and Anglo-Normans; and in the reign of Edward IV., if not earlier, the boot-proper, with tops and spurs, was established as an article of knightly dress. (See *Book of the Feet*, by J. Sparkes Hall, London.) In the reign of Charles I., a species of boot, exceedingly wide at the top, made of Spanish leather, came into use; and with Charles II. the highly decorated French boot was introduced as an article of gay courtly attire. Meanwhile, the jack-boot, as it is called (see JACK), had become indispensable in the costome of cavalry soldiers and horsemen generally; and by William III. and his followers it was regularly naturalized in England. Strongly made, the jack-boot extended in length above the knee, was capacious at top, had a very high heel, and round the ankle it had a flat leather band bearing a powerful spur. This huge species of boot remained in use in British cavalry regiments until comparatively recent times, and was dismissed as being too cumbrous in the case of men being dismounted. It is, nevertheless, in a somewhat polished and improved form, still worn by the horse-guards, with whose stalwart appearance, doing duty in their tall B. at Whitehall, most people are familiar.

As an improved jack, the horse-guards boot bears a remarkably close resemblance to the boot of the French postilion, well known to the older class of continental tourists. French postilion B., however, it is proper to understand, are made of that capacity that will suit any ordinary foot and leg. Kept economically as part of the equipment of a posting-house, they are ready for all legs, with or without stockings, as the case may be; and looking at the strength of their materials, they may very fairly be supposed to accommodate all the postboys of an establishment during half a century.

The jack-boot is almost entitled to be called the parent of the top and some other varieties. B. with tops of a yellow color were so commonly worn by gentlemen in the 18th c., as to become a peculiarity in the national costume of the English. When Philip, duke of Orleans, and other revolutionists of note, affected to imitate the sentiments and manners of the English, they ostentatiously wore top-boots. In the early years of the present century, a number of members of the house of commons, among whom may be specified the late sir Francis Brudett, habitually wore top-boots; nor have they yet entirely disappeared. By jockeys and fox-hunters, they are likely to remain in permanent use. What perhaps contributed to break up the general use of top-boots, was the introduction of the Hessian boot as an article of walking-dress. Worn over tight pantaloons, the Hessian boot was a handsome piece of attire, giving, undoubtedly, an elegant appearance to the nether costume. B. of this shape, as is seen by engravings, were worn by English general officers in the early part of the French war, and somewhat later. At length they were superseded by the well-known Wellington boot, which, as its name imports, was introduced by the great duke, as a simplification, under the loose military trouser. This species of boot has, in its turn, been almost entirely abandoned in England, in consequence of the universal use of short ankle B.; but it is still generally used by some classes of persons in the United States, though in an odd fashion, with the trousers stuffed loosely in at the top.

BOOTY is the victors' share in property captured from the vanquished. It is generally a military term, the word *prize* being more frequently used in the navy. The regulations concerning B. in the British army were collected and consolidated in 1831, and have only been slightly altered since. All military B. is apportioned as the sovereign from time to time may direct. Deserters, and those who do not claim their share within six years, receive none. The officers appoint two B. or prize agents, by letters of attorney; the field-officers naming one, and the subordinate officers another. The officer commanding the successful expedition sends two the military authorities a list of the persons entitled to booty. The agents collect the property, convert it into money at the best advantage, and hand over the proceeds to the authorities, receiving a small percentage for their trouble. A scale of distribution is then made out, and the money is paid after a certain interval. When an army and a fleet join in a capture, the admiralty calculates the army share, and sends the amount to the military authorities. Prize and B. originally belonged to the sovereign, and are only distributed to the captors as an act of grace; for, if the sovereign pleases, the property can be given back again to the enemy. See further, under PRIZE.

BOPP, FRANZ, Ordinary Professor of Oriental Languages at Berlin, was born at Mainz, on the 14th Sept., 1791. Devoting himself exclusively to the study of oriental literature, he spent some years in Paris, where he was encouraged in his labors by Chezy, Silvestre de Sacy, and August Wilhelm Schlegel, and afterwards visited

London, to prosecute his favorite studies more thoroughly, being partly supported by a small pension from the king of Bavaria. His first publication was on the Sanscrit verb; he afterwards produced a Sanscrit grammar, a *Glossarium Sanscritum*, and editions of several fragments of the great Indian epic, the *Mahabharata*, in the original text, with a translation. He helped much to facilitate the study of Sanscrit in Europe. But his most important labors centered in the analysis of the grammatical forms of the different languages of the Indo-Germanic family, by which he may be said to have founded a new science of comparative grammar. His great work in this department is a comparative grammar of the Sanscrit, Zend, Greek, Latin, Lithuanian, Old Slavonian Gothic, and German (*Vergleichende Grammatik*, etc., Berl. 1833, etc.; a second edition, entirely recast, was published in 1857). An English translation by lieut. Eastwick, and conducted through the press by Mr. Wilson, Boden professor of Sanscrit in Oxford university, was published in 3 vols., 1845–50. In recognition of his splendid services to philology, he was, in 1842, made a knight of the newly erected French, *Ordre du Mérite*, and, in 1857, foreign associate of the French institute. He died in 1867.

BOPPARD or BOPPART (ancient *Baudobriga*), a walled t. of Rhenish Prussia, situated on the left bank of the Rhine, about 9 m. s. of Coblenz. B. is a very ancient place, with dark, narrow streets, and chiefly built of wood. Its appearance, however, is picturesque, and it has several buildings, architecturally remarkable. The church of the Carmelites contains some fine specimens of 16th c. sculpture. During the middle ages, B. was an imperial city, and many councils were held in it. Remains of the Roman fortress built by Drusus still exist in the town. Near B. is Marienberg, the famous hydropathic resort. Pop. '75, 5269.

BORA, KATHARINA VON, or CATHARINE DE BORA, the wife of Luther, was b., it is supposed, at Löben, near Schweinitz, in Saxony, on 29th Jan., 1499. At a very early age, she entered the Cistercian convent of Nimptschen, near Grimma. Becoming acquainted with Luther's doctrines, she found herself very unhappy in her monastic life; and finally, along with eight other nuns, whose relatives, like her own, refused to listen to them, she applied for assistance to Luther. Luther obtained the services of Leonhard Koppe, a citizen of Torgau, and by him and a few associates the nine nuns were liberated from the convent in April, 1523. They were brought to Wittenberg, where Luther had suitably provided for their reception. Catharine became an inmate in the house of the burgomaster Reichenbach. Luther, through his friend, Nicholas von Amsdorf, minister in Wittenberg, offered her the hand of Dr. Kaspar Glaz, who became pastor in Orlamunde. She declined this proposal, but declared herself ready to marry Von Amsdorf, or Luther himself, who had already laid aside his monastic dress. Her marriage with Luther took place on 13th June, 1525, and was made the occasion of much unjust reproach by his enemies, which has not ceased to be repeated to this day. In his will, he left her all that he had, so long as she should remain a widow, because, as he says, she had always been an affectionate and true wife to him. After Luther's death, the elector of Saxony and Christian III. of Denmark, contributed from time to time to her support. She died at Torgau, on 20th Dec., 1552.

BORACIC ACID is found native (1) in the steam or vapor which rises from certain volcanic rocks in Tuscany, and (2) as a saline incrustation in the crater of a mountain in the island Volcano, which is situated 12 m. n. of Sicily. This crater is about 700 ft. deep, the sides lined with a crust of B. A. about half an inch thick, and is sufficient to yield an annual supply of 2000 tons. B. A. also occurs in combination in borax (q.v.), datholite (q.v.), boracite, and other minerals, and to a very minute extent in trap-rocks generally. The Tuscan supply of B. A. may be regarded as the most important, and its collection takes place over an area of about 30 miles. The plan pursued is to form a series of caldrons—100 to 1000 ft. in diameter, and 7 to 20 ft. deep—partly by excavation, and partly by building, in the side of the volcanic mountain where the steam and B. A. vapors are issuing from fissures, and divert the course of a mountain stream, so that at pleasure the caldrons, or *lagoons*, may be supplied with water. As the volcanic vapors—called *suffioni*—gurgle through the water contained in the lagoons, the B. A. is arrested by the water, which becomes impregnated with it. The liquid is passed from one lagoon to another, then on to settling vats and flat-bottomed evaporating pans, till it becomes so concentrated that on cooling, impure crystals of B. A. separate. In this condition it is sent to England and other countries. The appearance of the surface of the ground, from which thousands of jets of steam are constantly issuing, is very striking; and the name given to one of the principal mountains, *Monte Cerboli* (*Mons Cerberi*), denotes the feeling of awe with which the peasantry regarded the district as the entrance to the lower regions. Native B. A. is employed as a source of borax (q.v.) and contains about three fourths of its weight of true B. A., accompanied by one fourth of water and impurities. In a pure condition, B. A. may be prepared by dissolving 40 parts of borax ($NaO,2BO_3$) in 100 of water, and acting thereon by 25 parts of hydrochloric acid (HCl), which removes the soda, forming chloride of sodium (NaCl) and water (HO), and on cooling the mixture, the B. A. (BO_3) crystallizes out. On re-solution in water and re-crystallization, it is obtained in pure white feathery crystals. B. A. is used in the arts as a flux, as an ingredient in the glaze employed in pottery; and the wicks of stearine and composite candles are treated with it, so that when the candle is

burning, the end of the wick when it gets long, may fuse and fall to the side, where it can be burned away. The exportation of B. A. from the Tuscan logoons exceeds 3,000,000 lbs. annually.

BORAGE, *Borāgo*, a genus of plants of the natural order *boragineæ* (q.v.), having a wheel-shaped corolla, the mouth of which is closed with five teeth, and forked filaments, of which the inner arm bears the anther, the anthers connivent around the style, in the form of a cone. The species are few, chiefly natives of the countries around the Mediterranean sea. The COMMON BORAGE (*B. officinalis*) is found in waste places in many parts of Europe, and is pretty frequent—perhaps naturalized—in Britain. It is a plant of rather coarse appearance, with a stout erect herbaceous stem, 1 to 2 ft. high, somewhat branched; the lower leaves elliptical, obtuse, tapering to the base; the stem, leaves, flower-stalks, and calyx rough with hairs. The flowers are more than half an inch broad, of a beautiful blue color. B. was formerly much cultivated and highly esteemed, being reckoned amongst the *cordial* flowers, and supposed to possess exhilarating qualities, for which it no longer receives credit. The belief in its virtues was at one time extremely prevalent in England, and its use accordingly universal. The flowers were put into salads, Gerarde tells us (1597), "to make the mind glad;" and he adds: "There be also many things made of them, used everywhere for the comfort of the heart, for the driving away of sorrow, and increasing the joy of the mind." Like some other plants of the same order, B. contains nitrate of potash (niter), and is slightly febrifuge. It is mucilaginous and emollient, and has been used in pectoral affections: its leaves impart a coolness to beverages in which they are steeped: and with wine, water, lemon, and sugar, enter into the composition of an English drink called a *cool tankard*. The young leaves and tender tops are pickled, and occasionally boiled for the table.

BORAGINEÆ, or BORAGINA'CEÆ, a natural order of dicotyledonous plants, consisting chiefly of herbaceous plants, but also containing shrubs and even trees, the leaves generally rough with hairs which proceed from a thick hard base, and the whole plant mucilaginous and emollient. The leaves are alternate and without stipules. The flowers are in spikes, racemes, or panicles which are almost always coiled up, and gradually uncoil and elongate themselves, the flowers expanding in succession. The calyx is 4 to 5-partite, and remains till the fruit is ripe; the corolla is generally regular, 4 to 5-cleft, imbricated in bud; the stamens rise from the corolla, and are equal in number to its divisions—generally five—and alternate with them. The ovary is 4-partite, 4-celled; the style simple, arising from the base of the lobes of the ovary. The fruit consists of 4—or sometimes of 2—distinct achenia. See ACHENIUM.—The order *ehretiaceæ* of some botanists differs chiefly in the fruit, which in the more typical species is a succulent drupe; and in the heliotropes consists of four dry achenia more or less consolidated.—There are about 600 known species of the proper *boragineæ*, and about 300 of *ehretiaceæ*. The former are natives principally of temperate climates, and are particularly abundant in the s. of Europe and in the temperate parts of Asia; the latter are more tropical, but not exclusively so. Borage (q.v.), alkanet (q.v.), comfrey (q.v.), and forget-me-not (q.v.) are familiar examples of the former; the exquisitely fragrant heliotrope (q.v.) is the best known of the latter. The drupes of some species of *ehretia* are eatable.

BO'RA SAM'BA, a curious little half-independent state, or raj, in India, within the jurisdiction of the political agent for the s.w. frontier of Bengal. Its central point is in n. lat. 20° 55', e. long. 83° 10'; its area is about 622 sq.m.; the pop. is estimated at 28,000. The country is rugged, and the people savage. Outlaws from other parts of India have too often found refuge here. The revenue is about £400 a year. A tribute of £16 is paid to the British government.

BORAS'SUS. See PALMYRA PALM.

BORAX, or BIBO'RATE OF SODA, is found native as a saline incrustation on the shores of certain lakes in Persia and Thibet. It also occurs in India, China, Ceylon, Saxony, and South America. When collected on the banks of the lakes, it is impure, and goes by the name of *tincal*. The latter is purified by acting upon it with a solution of caustic soda, which removes the fatty matter that the crystals are coated with, to prevent evaporation of the water they contain, and thereafter dissolving in hot water and recrystallizing. B. is likewise prepared from boracic acid (BO_3), (q.v.), by solution in boiling water, and the addition of a boiling solution of ordinary carbonate of soda ($NaOCO_2$), when B. ($NaO,2BO_3$) is formed, and carbonic acid (CO_2) is disengaged, and on cooling in wooden tanks lined with lead, the crystals of B. separate. The common crystalline variety of B. contains 10 equivalents of water ($NaO,2BO_3 + 10HO$); but if a stronger than ordinary solution be allowed to cool, crystals begin to separate at a higher temperature than usual, which contain only 5 atoms of water ($NaO,2BO_3 + 5HO$). B. is soluble in water to the extent of one part of the salt in two parts of hot water, and in twelve of cold, yielding a clear solution with a sweetish taste. It is readily reduced to powder, and is then known as *powdered borax*. It is of great use in the chemical arts. As an assistant agent in experimenting with the blow-pipe (q.v.), B. is of great service, from the readiness with which it forms colored glasses with the various metallic oxides. It

is also employed in the manufacture of enamel, and for glazing or coating vessels in English pottery, as also in the formation of the paste for artificial gems. To the metallargist, it is an aid in the readiness with which it promotes the fusion of metallic mixtures, and the separation of the metals; and to the solderer of all metals it is of service in forming a thin glassy coating over the edges of the metals, which prevents their oxidation at the time they are being joined together. B. is also used in dyeing.

BORBECK, a t. in Prussia on the Ruhr, 4 m. n.w. of Essen; pop. '71, 16,857. It has a castle. Its iron industry is large, and there are coal-mines in the neighborhood.

BORDA, JEAN CHARLES, an eminent practical mathematician and astronomer, was b. on 4th May, 1733, at Dax, in the department of the Landes, in France. In 1771, he was associated with Verdun and Pingré in proving the accuracy of chronometers. He also devoted much attention to the subject of ship-building, and suggested great improvements in the form of vessels. In 1787, he took an active part in bringing the observatories of Paris and Greenwich into closer relations with one another. Along with Delambre and Méchain, he was a leading member of the French commission intrusted with the measurement of a meridian arc. He rendered essential service in the commission on the new system of weights and measures. He invented a new instrument for measuring the inclination of the magnetic needle; and his corrections of the seconds pendulum are still in use. But his reputation depends most of all on his improvement of the reflecting circle, on which instrument he published a work in two volumes (Par. 1787). He died at Paris on the 20th Feb., 1799.

BORDEAUX, an important seaport town of France, chief town in the province of Gironde, beautifully situated in a plain on the left bank of the Garonne, about 60 m. from its mouth in the Atlantic. Ships of more than 1000 tons burden can easily ascend the river at high-water to B., which is accessible at all times to vessels of 600 tons. Its harbor is very capacious; and, by the Garonne, its commerce very extensive. The river is crossed by a noble bridge of 17 arches and 532 yds. in length, erected by the elder Deschamps in 1811–21. The old town, consisting partly of high wooden houses of the 15th c., has narrow crooked streets; but the newer parts of the city and the suburbs have wide streets, fine squares, and pleasant promenades lined with trees. The cathedral, which was consecrated in 1096, is remarkable for its beautiful towers. The church of St. Croix is a building of the 10th c.; that of St. Seurin is also very old, and has rare Gothic ornaments. The former archiepiscopal palace is now the town. The great theater is one of the largest and finest buildings of its kind in France. B. has many other fine public buildings, and learned associations, and educational and benevolent institutions, with a public library of upwards of 140,000 volumes. The university, founded by pope Eugenius IV. in 1441, has been, since 1839, an *Académie Universitaire*, with 15 professorships. Pop. in 1876, 212,111.

Among the principal branches of industry are the production or preparation of sugar, brandy, liquors, vinegar, nitric acid, printed calicoes, woolen goods, carpets, hats, paper, earthenware, glass bottles, metallic wires, madder, and resinous articles. The rope works, cooperages, and dock-yards are extensive and full of activity. The canal du Midi, connecting B. with the Mediterranean, enables it to supply the whole s. of France with the colonial produce which it imports; and also with English tin, lead, copper, coal, dye-stuffs, herrings, etc. Wine, brandy, vinegar, dried fruits, hams, turpentine, and glass bottles are among its principal exports.

Except the wines of Champagne, no French wines are so much exported to foreign countries as those grown in the district of B., and known as BORDEAUX WINES. Some of them are red (known in England as *claret*), others white. Of the red wines, the Medoc is one of the best known. The red wines produced by the vineyards of Lafitte, Latour, Château-Margaux, and Haut-Brion are particularly celebrated for their quality. The white wines of Graves, and those of Sauternes, Barsac, Preignac, and Langon are in highest repute.

In former times, B. was called *Burdigala*, and was the capital of the *Bituriges Vivisci*. It was a very prosperous town in the times of the Romans, was made by Hadrian the capital of Aquitania Secunda, and was both the principal emporium of the s.w. of Gaul, and the seat of its best educational institutions. It was taken by Charles Martel in 735, but was again spoiled by Norman plunderers in the 9th century. It became the capital of the duchy of Guienne; and in 1152 passed, by the marriage of Eleanor of Guienne with Henry of Normandy (afterwards Henry II. of England), under the dominion of England. B. was for a considerable time the seat of the splendid court of Edward the black prince. During the revolution, B. was the principal seat of the Girondists, and suffered fearfully at the hands of the Terrorists. Its inhabitants, disaffected to Napoleon's government, were the first to declare for the Bourbons in 1814. During the Franco-Prussian war, a delegation of the government of national defense, retreating before the advancing German army, stationed itself, Dec., 1870, at B.; and the first sittings of the national assembly in 1871 were held there. Since the restoration of peace, the export-trade of B. has increased greatly. In wines, there was an increase, between 1859 and 1871, of 124 per cent in the quantity, and 73 per cent in the value—arising from the amount of cheap wine shipped from the port during the two previous years. About one sixth of the total export of this article goes to the British dominions.

BORDELAIS, a district of France, once forming part of the old province of Guienne, and having Bordeaux for its capital, but now included in the department of Gironde and Landes.

BORDEN, SIMEON, 1798–1853; b. Mass.; an engineer, self-educated; inventor of an apparatus for measuring base lines in trigonometrical surveys; and superintendent of the state survey of Massachusetts, the first geodetic survey in the United States. He published *A System of Useful Formulæ adapted to the Practical Operations of Locating and Constructing Railroads*, and was himself the constructor of several such roads.

BORDENTOWN, a village and township in Burlington co., N. J., 6 m. s.e. of Trenton; pop. '80, 5,334. It is on the bank of the Delaware river, and on the Raritan canal, and the Camden and Amboy railroad. Manufacturing is the principal business. Near B. is the former residence of Joseph Bonaparte, brother of Napoleon. The Bordentown college for women is the principal institution of learning.

BORDER, THE, is a term employed in historical as well as popular phraseology to signify the common frontier of England and Scotland. At present, the dividing boundary of the two countries consists partly of natural and partly of imaginary outlines. It is customary to speak of Scotland as a country "north of the Tweed;" but the Tweed is the boundary only in a small part of its course, on the e., and large portions of several Scottish counties lie to the s. of that river. Even at its mouth, the Tweed is not the division; for n. of the river at its estuary lies the ancient town of Berwick, with the district known as its "bounds," which belong to England. The Tweed forms the division only for about 16 to 18 miles. Leaving the river at Carham Burn, a few miles above Coldstream, the line proceeds towards the Cheviot mountains, the ridge of which is the boundary for about 25 m.; descending thence, the line strikes on Kershope water, a tributary of the Esk. That river is the boundary for a number of miles to a point above Longtown. The line now quits the Esk abruptly in a northern direction, and taking into England part of what was known as the "Debatable Land" (q.v.), strikes on the small river Sark, which is the boundary to the Solway firth, the great natural division on the west. Such, in general terms, is the entire boundary, extending from sea to sea for about 100 m., in which length the Tweed obviously plays an inferior part. The counties lying on the English side of the border are Northumberland and Cumberland; on the Scottish side, Berwickshire, Roxburghshire, and Dumfriesshire. Readers of history are aware that the division here indicated is comparatively modern; in former times, the frontier shifted according to the surging tide of war or diplomacy. For several ages prior to the 11th c., the kingdom of Northumbria, forming a part of what we now call England, included all that portion of Scotland s. of the firth of Forth as far w. as Stirling. As a result of some warlike operations, this district was ceded by the earl of Northumberland to Malcolm II., king of Scots, 1018, and ever since the Tweed, in its lower part, has been the boundary. What, however, was gained by Scotland on the e. was lost on the w.; for William the conqueror wrenched Cumberland from the northern sovereign; and with little intermission the boundary in this quarter was settled according to its present limits.

It may be said that from the 11th till the end of the 17th c., there was almost constant disturbance on the border. Ruthless wars on a great scale between English and Scots sometimes caused the most frightful devastation, and became the source of lasting ill-will on both sides. History abounds in events of this kind, and the feuds and forays of clans and families are commemorated in a series of ballads, forever embalmed in the *Minstrelsy of the Scottish Border*, by sir Walter Scott. The most notable of these forays from the Scottish side is narrated in the ballad of the *Battle of Otterburne*, or, as it is sometimes called *Chery Chase*. The event referred to occurred in 1388. Among the latest of the regular invasions from England was that in 1543, in the reign of Henry VIII., conducted by the earl of Hertford. The invasion was by the eastern marches, and in their devastating course, the English army set fire to and destroyed all the towns, villages, monasteries, and numerous castles within a wide range of country. At an early date, wardens and commissioners had been appointed to repress petty insurrections, and punish the moss-troopers who made cattle-lifting from their neighbors on the opposite side of the border a kind of profession. For these measures of police, the border was divided into three parts—the east, middle, and western marches. Such was the lawlessness in the early part of the 16th c., that in 1511, sir Robert Kerr, warden of the eastern marches, was slain at a border meeting by three Englishmen. The principal murderer escaped as far as York, and for a time tried to conceal himself; but he was sought out by two of sir Robert's followers, who brought his head to their new master, by whom, in memorial of their vengeance, it was exposed at the cross of Edinburgh (Scott's *Essay on Border Antiquities*). Sometimes the Scottish borderers met ostensibly to amuse themselves with the ancient sport of football, but in reality to plan and execute daring military exploits. During the reigns of Elizabeth and James VI., strenuous efforts were made to preserve peace on the border, and this was attained only by extraordinary severities. Many of the more audacious reivers were hanged, and great numbers were banished. Some account of the measures adopted at this period to suppress border outrages will be found in the *Memoirs of Sir Robert Cary*, who long acted as English warden on the marches; also in the *Domestic Annals of Scotland*, by R. Chambers, vol. i.

After the accession of James to the English throne, a sweeping clearance of the Scottish border was effected. The laird of Buccleuch collected under his banners the most desperate of the border marauders, whom he formed into a legion for the service of the states of Holland. At the same time, the debatable land was cleared of the Græmes, a daring sept of freebooters, who were transported to Ireland, and their return prohibited under pain of death. The legislative union of 1707, and the firm administration of justice, along with a general improvement in manners, finally terminated the long course of misrule.

In the present day, there is nothing to distinguish the border from other districts of the country, unless it be the prevalence of picturesque ruins of old castles, generally roofless, but, from the vast thickness and strength of the walls, still in a good state of preservation. The border strengths were of three kinds—regular fortresses, large baronial castles, and the lesser kind of towers. On the e., the English owned the fortified town of Berwick, and at no great distance Newcastle-on-Tyne; and on the w., Carlisle. The chief Scottish border fortresses were the royal castles of Roxburgh, Jedburgh, and Lochmaben; and we might almost include Edinburgh castle, for it is only 60 m. distant. Among the baronial castles on the English side were numbered Norham, Alnwick, Bamborough, Naworth, Brougham, Penrith, and Cockermouth. Among the Scottish fortlets of the baronial class may be mentioned Newark, Hermitage, and Caerlaverock. The smaller kind of towers on both sides of the frontier appear to have been exceedingly numerous, and it is their remains that form the more conspicuous memorials of old border strife. These buildings consist of a single square tower, usually of three floors; the lower vaulted, for the reception of cattle; while the two upper, consisting of but one small apartment each, with narrow slit-hole windows, comprised the accommodation for the family. It is conjectured, however, that retainers lived in thatched huts outside, which are now obliterated, and were brought into the tower, along with the cattle, only in the case of an anticipated attack. These towers, known as bastel-houses or peels, once the residences of a warlike yeomanry, are thickly studded over the s. of Scotland, more particularly along the vale of the Tweed; and by the lighting of beacons on their summits, the whole country between the border and the Forth could be speedily summoned to arms. On the English side, there are similar towers, such as those of Thirlwall, Fenwick, and Widdrington. The English border castles of every kind appear to have been of greater splendor and strength than those on the Scottish side. "Raby castle, still inhabited, attests the magnificence of the great Nevilles, earls of Westmoreland; and the lowering strength of Naworth shows the power of the Dacres" (*Scott*). On the English side, however, there is nothing which can be compared to the ruins of that remarkable group of Scottish border abbeys—Melrose, Dryburgh, Kelso, and Jedburgh, not to speak of the remains of various other religious houses. For an account of these and other architectural remains on the border, we must refer to the *Border Antiquities of England and Scotland*, by sir Walter Scott, 2 vols. folio, illustrated with plates; also to Billings's *Baronial and Ecclesiastical Antiquities of Scotland*, 4 vols. 4to, illustrated with plates.

Assimilated in habits to the rest of the population, the old Scottish border families are still distinguishable by their surnames—as, for example, the Maxwells, Johnstons, and Jardines on the w., and the Elliots, Armstrongs, Scotts, and Kerrs on the middle and eastern marches. The principal Scottish border families of rank are the Scotts, dukes of Buccleuch, descendants of a famed border chief, sir Walter Scott of Buccleuch; and the Kerrs, dukes of Roxburgh, who are sprung from an equally celebrated borderer, sir Robert Kerr of Cessford. The possessions of both families are extensive, particularly those of Buccleuch (q.v.), which spread through several counties. The family of corresponding rank within the English border is that of the Percies, dukes of Northumberland. Local intercourse across the border is considerably obstructed by the long range of hills and the moors which generally lie on the line of boundary; and the circumstance of the peculiar civil and ecclesiastical institutions of the two kingdoms shedding off here towards different centers, still further tends to lessen community of feeling. At no distant day, certain exciseable articles were charged with a less duty in Scotland than England, and the consequence was an active contraband trade on the border, chiefly by the mountain-passes and the Solway. Now, these duties are assimilated, and this demoralizing kind of traffic has disappeared. The great channels of communication across the border are two railway routes, one by way of Berwick, and the other by Carlisle. There are also good roads in various directions for those who wish to explore this interesting district of country. Besides the books relative to the border already referred to, there are some works of local note, among which the most comprehensive is Richardson's *Borderer's Table-book*, 8 vols. royal 8vo (Newcastle-on-Tyne); we may also refer to Jeffrey's *History and Antiquities of Roxburghshire*, 3 vols.; and Ridpath's *Border History*, 1 vol. 4to. W.C.

BORDER-WARRANT, in the law of Scotland, is a warrant issued by the judge ordinary—that is, by the sheriff or county court judge, or by magistrates of royal burghs within the royalty, or by justices of the peace—on the borders between Scotland and England, on the petition of a creditor who desires to arrest the person or effects of a debtor residing on the English side, and to detain him until he finds bail for his appear-

ance in, and abiding the result of, any action which may be brought for the debt within six months. The creditor must swear to the truth of the debt, and before resorting to imprisonment of the debtor, it is proper to examine him as to his domicile, or usual residence, and occupation. These warrants are in use in the counties of Dumfries, Roxburgh, and Berwick. They are more used in the country districts than in the burghs, though not frequently even in the country districts. In Dumfriesshire and Berwickshire, border-warrants are granted exclusively for arresting the persons of alleged debtors. In Roxburgshire—with the exception of the courts of the justices of the peace in Kelso and Melrose districts, which follow the practice of the two first-named counties—the warrants are granted for the purpose of arresting both the debtor's person and goods. In the stewartry of Kirkcudbright, and in Wigtonshire, they are unknown.

In English practice, the warrant to arrest an absconding debtor, which includes any foreigner who may be in England on business or pleasure, is very similar. See ARREST-MENT FOR FOUNDING JURISDICTION; DEBTORS, ABSCONDING; FOREIGN ATTACHMENT; JURISDICTION.

BOR'DURE, or BORDER, in heraldry. Coats of arms are frequently surrounded with a B., the object of which is generally to show that the bearer is a cadet of the house whose arms he carries. The character of the B. often has reference to the profession of the bearer: thus, a B. *embattled*, is granted to a soldier; and a B. ermine, to a lawyer.

BORE is a tidal phenomenon at the estuaries of certain rivers. When a river expands gradually towards a very wide mouth, and is subject to high tides, the spring flood-tide drives an immense volume of water from the sea into the river; the water accumulates in the estuary more rapidly than it can flow up into the river; and thus there is gradually formed a kind of watery ridge stretching across the estuary, and rushing up towards the river with great violence. In some cases, this ridge, or B., is many feet in height, and contends against the descending stream with frightful noise. This phenomenon is observable in several British rivers, as the Severn, Trent, Wye, and Solway. The most celebrated bores are those of the Ganges, Brahmaputra, and Indus: in the Hoogly branch of the Ganges, the B. travels 70 m. in 4 hours, and sometimes appears suddenly as a liquid wall 5 ft. in height.

BORE is a name for the internal cavity of a cannon, mortar, howitzer, rifle, musket, fowling-piece, pistol, or other kind of fire-arm. It is in most cases cylindrical; but in the Lancaster gun the B. is oval; in the Whitworth gun, it is hexagonal; while in the Armstrong, and many other kinds of gun, it is furrowed by spiral grooves. Technically, the B. of a gun often means simply the diameter of the cavity, as when we speak of a gun "of 8-inch bore;" and in that case its meaning is equivalent to "caliber."

The BORING of a cannon is a process which may best be described in connection with CANNON FOUNDING. It is desirable to mention in the present place, however, that there is an operation called "boring-up" conducted at Woolwich arsenal, for enlarging the bore of a gun. It has been found in recent years that many of the old cannon are thicker and heavier than needful for the size of shot propelled, and that they could be fitted for the discharge of larger shot without danger. A change was begun in the armament of the British fleet in 1839 by substituting heavier broadsides; and as one part of the process, many of the old 24-pounders were "bored-up" to 32s; even some of the 18-pounders were found to be thick and strong enough to undergo this process. More than 2000 iron naval guns were thus treated at Woolwich preparatory to the change in 1839; and many others have since been similarly bored-up. About 1860, important experiments were carried on at Woolwich, to determine whether the old smooth-bore iron guns could not only be bored-up, but *rifled* at the same time. There were 15,000 of such guns belonging to the British government, and it was suggested that they ought to be improved, instead of being cast aside as useless in the event of the success of the Armstrong and Whitworth guns. The process has not proved altogether satisfactory.

BO'REAS, the Greek name of the n.e. wind, blowing towards Hellas from the Thracian mountains, and personified in mythology as the son of Astræus and of Eos or Aurora, and the brother of Notus, Zephyrus, and Hesperus. B. was said to dwell in a cave of the Thracian Hæmus, to which he carried Oreithyia, the daughter of the Athenian king Erechtheus, who bore him Zetes and Calaïs—employed as the symbols of swiftness—and Cleopatra, the wife of Phineus. According to Homeric fable, he begat, with the mares of Erichthonius, twelve horses of extraordinary fleetness. The rape of Oreithyia was represented on the arc of Cypselos, where B. instead of feet has the tails of serpents. He had a temple in Athens, because he destroyed the ships of the Persians under Xerxes: and at Megalopolis, a yearly festival was celebrated in his honor, because upon one occasion he helped the Megalopolitans against the Spartans.

BO'RECOLE. See KALE.

BORELLI, GIOVANNI ALFONSO, a distinguished mathematician and astronomer, and the founder of the iatro-mathematical school, born at Naples in 1608, was educated at Florence, and became professor of mathematics at Pisa, and afterwards at Messina. Having taken part in a revolt, he was obliged to leave Messina, and spent the remainder

of his life at Rome, where he enjoyed the patronage of queen Christina of Sweden, and where he died in 1679. He carefully observed the motions of the satellites of Jupiter, then little known, and seems to have been the first to discover the parabolic paths of comets. He made many valuable observations on a malignant fever in Sicily, and wrote a treatise on the causes of such fevers. He wrote also an account of an eruption of Etna, and a number of works on subjects of applied mathematics, of which the most celebrated is that *De Motu Animalium* (Rome, 1680–81). In this work, he applies the laws of mechanics to the motions of animals, regarding the bones as levers, in which the power acts between the weight and the fulcrum, and endeavoring to calculate the power of muscles from a consideration of their fibrous structure, and the manner in which they are united to the tendons. All more recent authors on the same subject have been much indebted to Borelli.

BORER, a name common to many insects of the Linnæan genus *ptinus*, the tribe *ptinores* of Latreille, coleopterous (q.v.) insects of small size, the larvæ of which—small, white, soft, worm-like creatures, with six minute feet—are furnished with strong cutting jaws (*maxillæ*), by means of which they eat their way in old wood, and similar substances, boring little holes as round as if made with a fine drill. Every one is familiar with the appearance of these holes, and with the injury done by these insects to furniture, etc. The holes are filled up, as the insect works its way onward, with a fine powder, formed from the wood which it has eaten; and finally it constructs for itself a little silky cocoon, and having passed through the pupa state in the bottom of its hole, comes forth a winged insect—a small beetle, in the widest popular sense of that term. One of the most common British species is *anobium striatum*, a dark-brown insect, not much above one line in length. The thorax, as in the whole tribe, is proportionately very large, and has a swollen hood-like appearance, the head being, as it were, received within it. This insect has long been noted for the pertinacity with which it stimulates death. This instinct appears to be common to the whole tribe, as it is also to many other insects. —Another species of the same genus, *anobium tessellatum*, has become an object of interest as one of the insects which, being sometimes heard to make a peculiar ticking noise, are connected with superstitious fancies and fears, and receive the name of death-watch (q.v.).

BORGET'TO, a t. of Sicily, in the province of Palermo, and 13 m. w.s.w. from Palermo. It is a long straggling town, of mean houses, but picturesquely situated on a wooded cliff overhanging a plain, and itself overhung by a lofty precipice of red rock. Pop. 6000.

BORGHE'SE, a family of great distinction in the republic of Siena, and afterwards at Rome. Camillo B. ascended the papal throne in 1605 as Paul V., and by him other members of the family were advanced to high positions. A marriage with the heiress of the family of Aldobrandini brought the B. family into the possession of great wealth. Camillo Filippo Ludovico B., prince B., born at Rome in 1775, joined the French army when it invaded Italy; and in 1803 married Pauline, the sister of Napoleon Bonaparte, and widow of gen. Leclerc. His wife subsequently received the principality of Guastalla, and he was created duke of Guastalla, and under the French empire he was for some time gov.gen. of the provinces beyond the Alps. He held his court at Turin, and was very popular among the Piedmontese. He sold the B. collection of artistic treasures to Napoleon for 13,000,000 francs, receiving in part-payment the Piedmontese national domains; but when these were reclaimed by the king of Sardinia in 1815, he received back some of the works of ancient art. After the overthrow of Napoleon, he separated from his wife, and broke off all connection with the Bonaparte family. He lost Guastalla, but retained the principalities of Sulmona and Rossano, his hereditary possessions. He died in 1832.—The *Borghese palace* is one of the most magnificent at Rome. The noble portico of the inner court is composed of 96 granite columns; the collection of paintings is remarkably fine.

BORGHE'SI, Bartolommeo, Count, a distinguished antiquarian, b. at Savignano, central Italy, on the 11th July, 1781. His father, Pietro Borghesi, who was one of the most accomplished scholars of his time, trained him to an early delight in learned pursuits. He studied at Bologna, and afterwards devoted himself to archæological researches. He arranged the numismatic collection in Milan, and that of the Vatican, of which he drew up a catalogue. In 1821, he fixed his residence in the republic of San Marino, where he died in 1860. The French government undertook the publication of his works, of which 7 vols. appeared in 1862–71. His principal work is his *Nuovi Frammenti Dei Fasti Consolari Capitolini Illustrati* (2 vols., Milan, 1818–20). His contributions to Forcellini's Latin lexicon are very highly prized.

BORGI, Giovanni, 1736–1802; a mechanic of small means in Rome, who was the founder of a ragged school in that city. After his death the school was sustained and enlarged, and especially supported by Pius VII.

BORGIA, a family originally Spanish, but which acquired great eminence in Italy after the elevation of Alfonso Borgia to the popedom, as Calixtus III., in 1455. He had previously been a privy-councilor of the king of Aragon. He died in 1458.—Rodrigo B. ascended the papal throne in Aug., 1492, under the name of Alexander VI. (q.v.).

Before his elevation to the popedom, he had a number of children by a Roman woman named Vanozza (Giovanna de' Catanei), of whom two, Cesare and Lucrezia, share their father's extraordinary historic infamy.—CESARE or CÆSAR B. was one of the greatest monsters of a time of depravity, when the court of Rome was the scene of all the worst forms of crime. He unscrupulously made use of the most sacred things as means to the most iniquitous ends. He had early received high ecclesiastical preferment, and his father, soon after becoming pope, invested him with the purple. But his father conferring upon his brother Giovanni the duchy of Benevento, with the counties of Terracina and Pontecorvo, Cæsar, as was believed, moved with envy, caused his brother to be assassinated. He obtained the duchy and counties for himself, and was permitted by his father to resign the purple and to devote himself to the profession of arms. He was sent in 1498 to France, to convey to Louis XII. a bull of divorce and dispensation from his marriage with Anne of Brittany. Louis rewarded him for the pope's complaisance with the duchy of Valentinois, a body-guard of 100 men, 20,000 livres of yearly revenue, and a promise of support in his schemes of ambition. In 1499, Cæsar married a daughter of the king of Navarre; and accompanied Louis XII. to Italy, where he undertook the conquest of the Romagna for the holy see. The rightful lords of that country, who fell into his hands, were murdered, notwithstanding that their lives had been guaranteed by his oath. In 1501, he was named by his father, duke of Romagna. In the same year he wrested the principality of Piombino from Jacopo D'Appiano, but failed in an attempt to acquire Bologna and Florence. He took Camerino, and caused Giulio Di Varano, the lord of that town, to be strangled along with his two sons. By treachery as much as by violence he made himself master of the duchy of Urbino. A league of Italian princes was formed to resist him, but he kept them in awe by a body of Swiss troops, till he succeeded in winning some of them over by advantageous offers, employed them against the others, and then treacherously murdered them on the day of the victory, 31st Dec., 1502, at Sinigaglia. He now seized their possessions, and saw no obstacle in the way of his being made king of Romagna, of the March, and of Umbria, when, on 17th Aug., 1503, his father died, probably of poison which he had prepared for twelve cardinals. Cæsar, also, who was a party to the design (and who, like his father, had long been familiar with that mode of dispatching those who stood in the way of his ambition, or whose wealth he desired to obtain), had himself partaken of the poison, and the consequence was a severe illness, exactly at a time when the utmost activity and presence of mind were requisite for his affairs. Enemies rose against him on all hands, and one of the most inveterate of them ascended the papal throne as Julius II. Cæsar was arrested and conveyed to the castle of Medina Del Campo, in Spain, where he lay imprisoned for two years. At length he contrived to make his escape to the king of Navarre, whom he accompanied in the war against Castile, and was killed on the 12th Mar., 1507, by a missile from the castle of Biano. With all his baseness and cruelty, B. was temperate and sober. He loved and patronized learning, and possessed in a remarkable degree a ready and persuasive eloquence. Machiavelli has delineated his character in his *Principe*.—LUCREZIA B. was a woman of great beauty. She was married first to Giovanni Sforza, lord of Pesaro, but this marriage was dissolved by the pope. She was said, without ground, to have lived in incest with her brothers and father. She next married in 1498, Alfonso, duke of Bisceglie, a natural son of Alfonso II. of Naples; but he was assassinated by her brother Cæsar in 1501. In Sept. of the same year, she married Alfonso of Este, who afterwards inherited the duchy of Ferrara. She died in 1520. Like her brother Cæsar, she shrank from no crime; but she also was a patroness of art and learning, and was therefore adulated by several poets. See Gregorovius, *Lucrezia B.* (1874).

BORGIA, LUCREZIA (*ante*), a greatly slandered woman, commonly supposed guilty of the most detestable sins. Modern research has tended to clear her of the charge of incest, so long believed, but of which the proof is entirely lacking. She was a woman of little strength of mind, and doubtless lacked the disposition to oppose the crimes of her father and her brother Cæsar; but after her marriage with the son of the duke of Ferrara she passed a quiet and prosperous life, and won universal respect by prudence, piety, and patronage of letters and art, dying in 1520.

BORGNE, LAKE, not exactly a lake, but an arm of the gulf of Mexico stretching into s.e. Louisiana, sometimes called Mississippi sound. The Rigolet pass connects it with lake Ponchartrain. It is about 60 m. long by 25 wide.

BORGO, a name given to a number of towns and villages in Italy and southern Tyrol, and indicating the growth of the town or village around a castle or castellated rock, the original Borgo. See BOROUGH. Thus, *B. di val Sugana* is a place of (1869) 4092 inhabitants, with a castellated hill, in Tyrol; *B. Lavezzaro* is an Italian t. in the province of Novara, with about 3000 inhabitants; *B. San Donnino*, in the province of Parma, with 6000 inhabitants; *B. San Sepolchro*, in the province of Arezzo, with 8000 inhabitants, etc.

BORGOMANE'RO, a t. of n. Italy, in the province of Novara, and 19 m. n.n.w. from Novara, situated near the left bank of the Agogna. It is a walled town, well built, and contains a communal college and a hospital. It has little trade. Pop. 5320.

BORGO SAN DONI'NO, a city of n. Italy, in the province of Parma, situated in a plain, 14 m. n.w. from Parma, on the railway between Parma and Piacenza. It is sur-

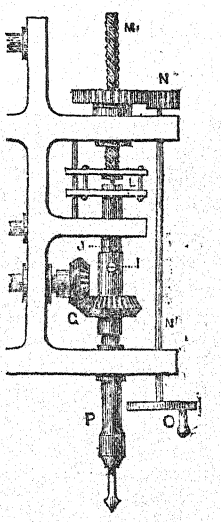
rounded by walls, has several good streets, is an episcopal see, and has a cathedral (the oldest part of which is in the Lombard style), several churches, and several educational institutions. Manufactures of silken, linen, and woolen fabrics are carried on; and oil and wine are produced in considerable quantities. The city derives its name from a saint, who is said to have been a soldier in the army of the emperor Maximian, and to have suffered martyrdom here. The shrine of St. Donino has long been one of the most frequented in Italy. There are some curious remains of very rude mediæval sculpture in the cathedral. Pop. about 4200.

BORGOTA'RO, a t. of n. Italy, in the province of Parma, and 35 m. s.w. from Parma, on the left bank of the Taro, a tributary of the Po. It is encircled by walls, and is well built. Pop. (including commune) 6938. The surrounding district is hilly and wooded.

BORGU, or BARBA; a large district in w. Africa, along the w. side of the Niger and n.e. of Dahomey. The surface is generally level, and the soil fertile and tolerably well cultivated, producing corn, yams, plantains, and limes abundantly. Cattle of good breed are numerous, and there is plenty of game. The people are honest, peaceful, and good-humored. B. is divided into a number of states, of which the smaller are dependent on the Fellatah kingdom of Gondo, while the state of Kitti is ruled by an independent and powerful chief who is sometimes spoken of as sultan of Borgu. The important cities are Wawa and Kiama. B. was the scene of the disastrous fate of Mungo Park, in 1805.

BORIC ACID. See BORACIC ACID, *ante*.

BORING, as a process in carpentry and in the working of metals, is performed in a variety of ways. For B. holes in wood the carpenter makes use of *awls*, which simply displace a portion of the wood, and of *gimlets*, *augers*, and *bits* of various kinds, these last being applied by means of the crank-shaped instrument called a *brace*. All these are too familiar to need description. The B. of holes in metal plates for making attachments, is effected by means of *drills* driven by machinery. The annexed figure shows the essential parts of such a B. machine. The drill is inserted in the end of a vertical spindle, P, which revolves in a fixed frame, and is driven by the bevel-wheels, G. The metal to be bored is placed on a table or other support below the drill; and the up and down motion, or end-pressure and off-action, of the drill is effected by the hand-gear, O, N, turning the screw M, which, being coupled to the top of the spindle at L, presses it down or raises it, according to the way it is turned. The spindle slides vertically in the collar forming the axis of the bevel wheel, but is carried round with it by means of the pin I, which projects into a groove seen at J.



Boring Machine.

The B. of cannon and of cylinders for steam-engines is most conveniently described under CANNON-FOUNDING; see also LATHE.

BORING, applied to the earth and to rocks, has two chief uses. 1. *For draining.*—In some districts, owing to the existence, near the surface, of a bed of clay impervious to water, the surface-water is retained in hollows, of greater or less extent. The expense of deep draining has been so great as to induce proprietors to neglect such land, but this expense has lately been avoided by leading drains to the lowest portion of the hollow, and then opening a bore through the clay to the pervious strata of sand or gravel beneath. This is done by a simple instrument, an auger of 2½ or 3½ inches in diameter, wrought by means of a cross-bar by one or two men.

2. *For artesian wells and for the discovery of the mineral contents of the earth.*—As the borings for these purposes are performed in the same manner, it is unnecessary to give them separate notices. The object of B. for artesian wells is to open a passage for the escape of water from water-logged strata. See ARTESIAN WELLS. In the search for minerals, B. is had recourse to as a cheap method of discovering the mineral wealth of a district, and whether the quantity and quality of the contained minerals are such as to make the working remunerative. It should, however, never be undertaken without a previous geological survey of the locality; the neglect of this has caused an immense loss of time and money in futile searches for minerals, as in the innumerable cases of bores driven into Silurian and old red sandstone strata, in search for coal. B. is also of use even after the presence of coal has been ascertained, to determine the most advantageous position for sinking the shaft by which the coal is to be drawn up. The general method of operating is as follows: The boring-instrument consists of an iron shank, having a cross-bar at the top and a hollow screw at the bottom; to this all the successive boring-instruments are fastened. A simple chisel is at first attached to the screw, and one or two men press upon the cross-bar, and at the same time force it round like an auger, while another workman, by means of a lever erected overhead, with a chain descending from it to the cross-bar, gives an up and down motion to the instrument. When the chisel becomes clogged, from the accumulation of material which it has loosened, it is exchanged for a cylindrical auger, provided with a valve, which scoops

out the separated material; and thus by alternate chopping and scooping the work is carried on. The nature of the strata is determined with considerable facility and certainty by examining the fragments brought up by the auger. As the work advances, successive lengths of rod are screwed on at the upper end. Three poles are erected over the well, for the purpose of elevating the rods, to permit the change of the tools.

The cost of B. varies with the material through which the operation is carried on. In strata of moderate hardness, the cost is about 10*s.* a fathom for the first 10 fathoms, and an additional 6*s.* for each 5 fathoms beyond.

A simple method of B. has been long in use among the Chinese, by which the great loss of time, arising from the screwing and unscrewing the rods, at each elevation of the chisel or auger, is saved. The chisel and scooping instrument are fastened to a rope, which is alternately elevated and allowed to descend by the simple force of gravity; the instrument thus forces its way through the ground. In the softer rocks of the newer formations this method has been successfully employed in B. for artesian wells.

A still greater saving in time and money has been obtained by a process invented by M. Fauvelle, and described by him before the British association in 1846. His apparatus consists of a hollow boring-rod, formed of wrought-iron tubes screwed end to end, armed at the lower end with a hollow perforating tool. The upper end of the hollow rod is connected with a force-pump by a flexible tube. By means of the force-pump a current of water is sent down the rod into the bore-hole as it is sunk, and the water coming up again brings with it all the drilled particles, so that, except for the renewal of the perforating tool, the rods do not require to be elevated. M. Fauvelle found, by experience, that when he was passing through gravel, or required to bring up considerable masses of broken-off rock, it was better to inject the water by the bore-hole and let it rise through the hollow tube. In this way he has succeeded in raising stones 2¼ in. long by 1¼ in. thick. For B. in tunnels, see TUNNEL.

BORIS'OV, a t. of Russia, on the Beresina, 44 m. n.e. of Minsk, near the place where Bonaparte's army crossed the river Borisov about the end of Nov., 1812. Pop. '67, 5233.

BORISSOGLIEBSK', a t. in Russia. 11½ m. s.e. from Jamboff, on the left bank of the Vorona, in 51° 22′ n., 41° 4′ east. B. was founded in 1646 for defense of the frontiers against the incursions of the Crim Tartars. It has an important trade in grain, wool, cattle, and leather, some manufactures, and two annual fairs. Pop. '67, 12,254.

BÖRKU, or BORGU, a country in the interior of Africa, between 17° and 20° n., and 18° and 21° e., forming a part of the great Soudan region. The climate is better than that of the surrounding countries, but the eastern trade-winds blow with great violence from early morning until about 3 P.M., drifting the loose sands into countless heaps, and changing their shape and position from day to day. A great part of the district was not long ago under water. The irrigated lands raise dates in abundance, of a dozen kinds. The northern valleys have a settled population of about 5000, known as the Donosa, or Dosa people; the other inhabitants and traders are nomadic. Dr. Nachtigal spent some time in B. in 1871.

BORLASE, Rev. WILLIAM, an English antiquarian, was born at Pendeen, Cornwall, Feb. 2, 1696. Ordained a priest in the English church in 1720, he was, in 1732, presented to the vicarage of his native parish of St. Just. Devoting himself to a study of the natural history and antiquities of Cornwall, he in 1753 published, at the Oxford press, a volume entitled *Observations on the Antiquities, Historical and Monumental, of the County of Cornwall.* This was followed, in 1758, by the *Natural History of Cornwall*, printed at the same press. B. paraphrased the book of Job, and wrote several pieces of a religious nature; was active in the supervision of his parish, and took an especial interest in the improvement of its highways. But that which makes his name most interesting now, is the fact that he was one of Pope's correspondents, and furnished to the poet most of the curious fossils of which the Twickenham grotto was composed. He died Aug. 31, 1772.

BORN, BERTRAND DE, d. about 1209; a French soldier and troubadour, of a family descended from the dukes of Aquitaine. He had a contest with his brother for the possession of the family heritage, and defeated him; but Richard cœur de lion took the side of the brother because B. had satirized the "lion-hearted" in certain songs. B. then favored Henry II. of England, and took part in the bitter political quarrels of the period. After Richard's death he seems to have led a quiet life; but that his songs had great influence is evident from the fact that Dante put him in the *Inferno* as wickedly inducing the young king to quarrel with his father; and historians refer to the influence of his songs and his deeds of arms as embittering the quarrels of the time.

BORN, IGNATIUS, Baron von; 1742–91; a Transylvanian mineralogist, educated in a Jesuit college; studied law at Prague; traveled in w. Europe, and then went into the department of mines and the mint at Prague in 1770. Against much opposition B. succeeded in substituting amalgamation for smelting and cupellation for extracting silver from the ores in the mines of Hungary. In 1766, Maria Theresa appointed him to arrange the imperial museum at Vienna, and soon afterwards he was made a councilor of state. B. took an active part in the political affairs of Hungary.

BORNA, a t. in Saxony, 16 m. s.s.e. from Leipsic; pop. '71, 5751. Here are ruins of an old castle destroyed by the followers of Huss in 1430.

BÖR'NE, LUDWIG; 1786–1837; a German political writer and satirist. He was the son of Jakob Baruch, a Jewish banker, but renounced the Hebrew faith and changed his name to Börne, by which only he is known. He was the editor of various journals which were successively suppressed by the government on account of their extreme liberalism. The one best remembered is *Der Wage*, in which B. had some powerful and sarcastic dramatic criticisms. His last literary venture was *La Balance*, published in Paris just after the revolution of 1830, in which he mercilessly satirized the German dynasty, which he looked upon as the great opponent of liberalism.

BOR'NEENE, FLUID BORNEO CAMPHOR, or OIL OF CAMPHOR, is a thin liquid, lighter than water, with a fragrant odor (somewhat resembling turpentine), obtained by distilling native oil of Borneo camphor, or oil of Valerian. The Borneene is employed in perfumery.

BOR'NEO (called by the natives *Pulo Kalamantin* or *Klemantin*, which is the name of an indigenous fruit), next to Australia and Papua, the largest island in the world, is situated in the Indian archipelago, in 7° n. to 4° 20′ s. lat., and 106° 40′ to 116° 46′ e. long. It is bounded on the e. by the sea of Celebes and the Macassar strait, s. by the sea of Java, w. and n. by the gulf of Siam and the China sea. Its length is about 800 m., with a breadth of 700, and an area of about 300,000 sq. miles. The pop. is under 2,000,000. The largest part, ruled by the Dutch, had, in 1873, 457 Europeans and 1,235,187 natives; the independent kingdom of Borneo or Brunaï, in the n., between Sambas and Maludu, 225,000; Sarawak, 50,000; and the unexplored regions of the interior are sparsely peopled. The coasts of B., which are often low and marshy, and rendered dangerous to navigation by numerous islets and rocks, present no deep indentations, though they are pierced by numerous small bays and creeks. Two chains of mountains run through the island in a nearly parallel direction from s.w. to n.e.; the one rising in Sarawak (q.v.) gradually increases in elevation until it attains, in its termination in Mt. Kini Balu, on the n.e. coast, a height of 13,698 ft.; a cross chain, branching off in about lat. 2° n., extends in a s.e. direction through Banjermassin (q.v.). The other range, which is much lower, intersects the equator in long. 113° e. Between are well-watered plains. B. has fine rivers, especially on the n. and w. coasts. About their upper courses, however, little is known. The principal are: on the n., the Brunaï or Borneo, the Redjang, Baram, Bintulu, Sirabas, Batang-Lupar, and Sarawak; on the e., the Kuteï or Mahakkan, Balungan and Kuran, or Beru. The Barito, or river of Banjermassin, Kahaijan, Kapuas-Murung, Mendawei, Sampit, and other smaller streams, flow through the s.e. part; while the Pontianak, or Kapuas-Pohang, Sambas, Simpang, Succadana, and Pawan, are the most important on the west. All the rivers of B. have banks at their mouths, which render them unfit for large ships; the Brunaï however, is navigable 15 m. for vessels of considerable tonnage. There are numerous lakes, abounding in fish, the largest being Kini Balu, at the foot of the mountain of the same name, 100 m. in circumference, beautified with islands, and having many Dyak villages on its bank. The climate, in the low grounds, is humid, hot, and unhealthy for Europeans; but in the higher parts towards the n. the temperature is generally moderate, the thermometer at noon varying from 31° to 91° F. During the rainy season, from Nov. to May, heavy storms of wind and loud thunder are experienced on the w. coast. Vegetation is extremely luxuriant. The forests produce iron-wood, teak, gutta-percha, ebony, sandal-wood, rattans, dye-woods, benzoin, wax, dragon's blood, sago, various resins, vegetable oils, and gums. The camphor is the best in Asia, of which 4500 lbs. are exported annually. The mohor tree, well adapted for making native boats, attains a height of 80 ft., and the Kaladang, suited for large masts, to 200. Nutmegs, cloves, cinnamon, pepper, betel, ginger, rice, millet, sweet potatoes, yams, cotton, sugar-cane, indigo, tobacco, coffee, melons, citrons, pine-apples, bananas, cocoa-nuts, etc., are largely grown. The mountains and forests contain many monkeys, among which is the orang-outang. Tapirs, tigers, bears, swine, wild oxen, and various kinds of deer abound. The elephant is only found on the n. coast, and the rhinoceros on the n.w. The few domesticated animals are buffaloes, sheep, goats, dogs, and cats. A few horses are seen in Banjermassin. The birds are remarkable for their plumage. The principal are eagles, vultures, Argus-pheasants, peacocks, flamingoes, pigeons, parrots, and the swallows (*collocalia esculenta*) which construct the edible nests prized by the Chinese for making soup. The rivers, lakes, and lagoons swarm with crocodiles, and many kinds of snakes, frogs, lizards, and leeches. Fish is plentiful, and the coasts are rich in tortoises, pearl-mussels, oysters, and bêche-de-mer, or trepang. Brilliant butterflies and moths are in great variety, and silk worms are found. Among the mineral products are coal, gold, antimony, iron, tin, platina, nickel, diamonds, precious stones, rock-crystals, porcelain-clay, petroleum, and sulphur. The diamond mines are chiefly in Landak and Pontianak (q.v.). Sambas produces the greatest quantity of gold; the kingdom of Brunaï, Kuteï, and Banjermassin, the largest amount of coal.

The population consists of three classes: the Dyaks, who are the aboriginal inhabitants, and almost all heathen; the Mohammedans or Malays, Buginese, Javans, and Arabs; and the Chinese. The Dyaks live chiefly in the interior, and employ themselves

with land culture, collecting gutta-percha, resin, gums, rattans, gold-dust, and wax. They are divided into numerous tribes. The Malays dwell on the coasts, are traders, and bold sailors. They are more civilized than the Dyaks, cultivate the grounds around their houses, lay out gardens, keep cattle, and live partly by fishing. The Chinese, chiefly from Canton, have penetrated far into the interior. They engage in trade and mining, are unwearied in their efforts to make money, and then return to their native country. They number about 75,000, and have always endeavored to live as an independent republic, under chiefs chosen by themselves, and according to Chinese laws. In 1857, the Chinese living in Sarawak (q.v.) rebelled against sir James Brooke (q.v.), and were nearly exterminated. In the last years, the Dutch were also compelled to put them down by force of arms, and have imposed a poll-tax.

The women of B., except the Dyak, weave cotton fabrics, make earthenware, baskets, and mats of beautiful designs and colors. In the district of Banjermassin are factories of weapons. The principal exports are gold, gold-dust, diamonds, coal, rattans, gutta-percha, edible nests, cotton, wax, timber, dye-woods, mats, resins, sandal-wood, camphor, etc.; the imports—earthenware, iron, steel, and copper work, piece goods, yarns, woolen and silk fabrics, medicines, provisions, wines, spirits, rice, sugar, tea, tobacco, opium, trepang, gambier, vegetable oils, gunpowder, etc. In 1872, the Dutch imports amounted to £411,238, and the exports to £299,210.

By far the largest part of the island is ruled directly or indirectly by the Dutch, who have divided it into the residency of the western division of B., and that of the southern and eastern, the former having Pontianak (q.v.) as the seat of government; the latter, Banjermassin. The smaller portion towards the n. and n.e. contains Sarawak and the territories of the sultan of B. proper. Besides a number of small dependencies, the western division contains the important kingdoms of Landak, Mampawa, and Sambas, with the mining district of Montrado, in the north. The chief towns are Sambas (10,000), Pontianak (9000), Banjermassin (30,000), Borneo or Brunaï (30,000), and Sarawak (25,000).

The Portuguese effected a settlement in 1690 at Banjermassin; from whence they were, however, soon expelled. The Dutch succeeded in concluding a treaty of commerce with the princes of Banjermassin; and in 1643 erected a fort and factory, a second in 1778 at Pontianak, and others since. The British made unsuccessful attempts in 1702 and 1774 to effect a settlement in B.; but have, within the last twenty years, acquired a preponderating influence on the north-western coast. This has been in a great measure owing to the enterprise of sir James Brooke (q.v.) and his vigorous government as rajah of Sarawak, and in part also to the occupation of Labuan (q.v.) as a colony and naval station. The British government, however, refused, upon sir James Brooke's retirement from Sarawak, to annex it to the British empire. The piracy carried on by the inhabitants of B. has often demanded severe chastisement, and piratical flotillas have been destroyed by the British.

BORNEO, or BRUNAI, a seaport in n.w. Borneo, on the Brunai river, 10 m. from the ocean. It is built in the water, the houses standing on piles, and all the streets having canals in them. Pop. about 25,000.

BORN'HOLM, an island in the Baltic sea, belonging to Denmark, and situated about 90 miles e. from Seeland, and half-way between the island of Rügen and the Swedish coast, lat. 54° 59′ to 55° 18′ n., long. 14° 42′ to 15° 10′ east. Area, including three small islands in its vicinity, about 230 sq.m., with a pop. above 51,000. It is rocky, and traversed from n. to s. by a high mountain-ridge, the slope of which is in great part a waste heath, but elsewhere it is not unfertile, and agriculture and cattle husbandry are successfully prosecuted. High cliffs, sand-banks, and breakers make the coast dangerous. The most notable product of the island is porcelain clay, with which the porcelain manufacture of Copenhagen is carried on. The capital of the island is Rönne, or Rottum, on the western coast, a place of (1870) 5505 inhabitants.

BORNING-PIECE (Fr. *borner*, to bound), a common and very simple implement, used by gardeners in laying out grounds, to make the surface either level or of perfectly regular slope. It consists of two slips of board, one about 18 in. long, and the other about 4 ft., the shorter fastened by the middle to one end of the longer, and at right angles to it. One borning-piece being placed at one end of a line drawn in the piece of ground which is being laid out, with the edge of the shorter slip of board along the line, and the longer slip erect, others of the same size are similarly placed at the other end and in other parts of the line; and the requisite uniformity of surface is obtained by filling up with earth, or removing it, until on looking along their summits it appears that they are all in the same plane. The name is perhaps derived from the application of the implement to borders or edgings.

BOR'NU, a powerful state of Central Africa, extending between lat. 10° and 15° n., and long. 12° and 18° e., and bounded on the e. by Lake Tsad, s. by Mandara, w. by Hausa, and n. by Kanem and the Sahara. The greater part of the country is perfectly level, and much of it is liable to be overflowed in the rainy season, which lasts from Oct. to April, when fevers and other diseases consequently prevail. The heat from Mar. to June is excessive, ranging from 104° to 107° F. The two principal rivers are the Shary and the Yeou or Yo, both of which fall into lake Tsad. The soil is fertile,

and although the cultivation is very imperfect, produces plentiful crops of maize, millet, barley, rice, various kinds of pulse, cotton, and indigo. The inhabitants possess elephants, horses, buffaloes, oxen, sheep, etc. Wild beasts, as lions, panthers, etc., are very numerous, having their chief haunts in the forests which occur only in the vicinity of the rivers, and which abound also in birds of many kinds, snakes, crocodiles, etc. Wild bees are extremely plentiful. The country produces no iron, that which is used being brought from Mandara. Much care is bestowed upon the manufacture of coats of-mail, both for horses and their riders. The only other manufacture carried to any considerable extent is that of cotton cloth, which is dyed with beautiful blue stripes by means of indigo, and much exported to Fezzan. The population, which is estimated at about five millions, are mostly of negro race, and called Kanowry. The ruling race, called Shouas, are of Arab descent, and bigoted Mohammedans; but many traces of Fetishism remain among the masses. Whatever they have of civilization is derived from the Arabs. The slave-trade is eagerly prosecuted, and gives occasion to many warlike expeditions. B. appears to have existed as a state for many centuries, but in the beginning of the present century it was conquered by the Feilatahs, whose yoke, however, was soon shaken off, under the leadership of a fanatic faki, named Mohammed el Amin, whose services were called in by the sultan. On Mohammed's death, his son Omar became ruler of B. instead of the sultan. Dr. Nachtigal, who visited B. in 1870, describes it as rapidly decaying.

BORO BUDDOR (the great Buddha), the ruin of a splendid Buddhist temple in Java, residency Kadu, regency Magelang, and district Minoreh, near the junction of the Ello and Progo, is the most elaborate monument of the Buddhist style of architecture anywhere existing. Buddhism (q.v.) was early introduced into Java, and Javanese chronicles place the building of B. B. in the beginning of the 7th century. The figure (copied from Fergusson's *Handbook of Architecture*) represents a section through one half, and an elevation of the other half of the building. It is a pyramid of a square form, each side at the base measuring 600 ft., and consists of seven walls, which are built like the steps of a stair up a hill. Between the walls are narrow terraces running round the building. The walls are richly ornamented with statuary. Outside are niches, each of which is occupied by a statue of Buddha, larger than life, seated in the usual attitude, with his legs crossed under the body. The number of these figures is about 400. Between each of these are bass-reliefs, representing the god in the same attitude, besides architectural ornaments and carvings of all sorts. Below the niches, on the lower story, is an immense bass-relief running round the whole building, representing scenes from the life of Buddha, and religious subjects. The inner faces of the building are also profusely ornamented with bass-reliefs, seated figures, and architectural ornaments, carried to an extent unrivaled by any other building in the world. The art of sculpture appears in Java to have early attained the highest point of excellence. "Above and within the upper square terrace are three circular ones, the outer ornamented with 32, the next with 24, and the upper with 16 small domes, each containing a seated statue of Buddha, which can be seen through the open-work of their roofs. The whole is surmounted by what must be considered as the pagoda (q.v.) itself, which is now empty, its center being occupied only by a sunken chamber 10 ft. deep, meant originally, no doubt, to contain the relic for which this splendid temple was erected." Mr. Fergusson considers that the five lower terraces are copied from and represent a Buddhist vihara or monastery; and that the niches containing the cross-legged figures were, in the originals, cells, each occupied by a shaven priest. The structure is thus a compound of a tope (q.v.) with a copy in durable architecture, of the frail cells of a vihara.

BORODI'NO, a village of Russia, in the government of Moskwa, and about 70 m. w. from the city of that name. It is situated on the Kalouga, an affluent of the Moskwa, and gave name to the great battle fought between the French army under Napoleon, and the Russian under Kutusow, Barclay de Tolly, and Bagration, 7th Sept., 1812. The battle of B. was one of the most obstinately disputed in history, and the loss on both sides was almost equally great. Out of 240,000 men engaged, between 70,000 and 80,000 were killed and wounded. The Russians retreated on the following day, but it was in the most perfect order, and without the enemy venturing to attack them. The Russians, therefore, have always held this battle as a victory, and in 1839 raised a fine mausoleum on the battle-field. To the French, however, certainly belongs the honor, as they not only remained on the field of battle, but in seven days after they had pushed on to Moscow. The French name it the battle of the Moskwa, from the river of that name, and it gave marshal Ney his title of prince of Moskwa.

BOR'ON (symb. B, equiv. 11) is a non-metallic element present in boracic acid (q.v.) and borax (q.v.). It was discovered in 1808 by Gay Lussac and Thenard in France, and Davy in England. The process followed in procuring B. till lately was to mix pure and dry boracic acid (BO_3) with thin slices of the metal potassium (K), and heat them in a tube, when three atoms of the potassium abstracted the oxygen, forming potash (KO), and set free the boron (B). On cooling and washing the mixture with cold water, the potash dissolved out, and left the B. as a dark, greenish-brown powder, which, when heated, burned with a green flame, and was re-formed into boracic acid, by combining with the oxygen of the air. Recently, however, Wöhler and Deville have obtained B. by heat-

ing in a crucible at a high temperature a mixture of pure dry boracic acid and the metal aluminium, when the latter takes the oxygen forming alumina (Al_2O_3), and leaves the B. as minute crystals interspersed through the earth alumina. These crystals possess great interest from their similarity in properties to pure crystallized carbon, or the diamond, and they are now known among scientific chemists as *B. diamonds*. They are remarkably transparent, are tinged yellow or red (though the colors may be accidental, and rival the ordinary diamond in their luster and refractive power. B. diamonds not only scratch glass, but also the corundum and the sapphire; and a real diamond, with which a few B. diamonds were crushed, had its edges worn away. It is apparent, therefore, that the B. crystals possess in a high degree the characters of the ordinary diamond; and though they have as yet only been obtained in minute specks, yet it is not too much to expect that the size will be increased, and the artificial B. diamond come into the market as an article of ornament, to rival the *natural* carbon diamond in its mysterious power of flashing back the rays of light. Indeed, so like are these two kinds of diamonds, that they can scarcely be distinguished by outward characters or signs; and it has been gravely suggested that some of the diamonds which now adorn the brow, the neck, or the arm, may be natural B. diamonds. They are very indestructible, requiring a high temperature to destroy them; and, like the true diamond, heat ultimately forms them into a *coke*.

BOROUGH (Ang.-Sax. *byrig, burg, burh;* It. *borgo;* Fr. *bourg;* Scot. *burgh*). The original meaning of this word, by which we now designate a corporate township, seems to have been a hill, rising-ground, or heap of earth; and it was probably from the elevated positions on which places of defense were erected, that it afterwards came to signify a fortification or castle, and latterly the aggregate of houses, churches, and other structures, which, in unsettled times, usually gathered under the walls of a castle; together with their inhabitants, and the arrangements which were made for their government. The questions whether we owe our municipal corporations to Roman, or to Saxon and other Teutonic influences, or to both; and if to both, then to what extent they have severally contributed to their formation, have been keenly discussed by constitutional historians. In so far as etymology goes, its authority is pretty equally divided, the term *municipal*, from the Latin *municipalis*, and *city*, from *civitas*, favoring the Roman view; whilst B. from the root above indicated, and *town*, from the Saxon *tun* or *dun*, a fortified hill, support the Teutonic. But the discussion forms a branch of a very wide subject, which has divided recent writers into two opposite schools, and of which we can here only indicate the existence. On the Roman side, sir Francis Palgrave is the most uncompromising, and Mr. Allen, as it seems to us, the more judicious champion. The Teutonic side is espoused by most of the Anglo-Saxon scholars of England, and in general by German writers. But from whatever source derived, that the boroughs of England existed, not as aggregates of houses merely, but as corporate bodies, in the Saxon time, is now generally admitted. The B. system of Scotland is also of great antiquity. "A *Hanse*, or confederation of boroughs for mutual defense and the protection of trade, existed in Scotland, and was known by this name in the reign of David I., about a century before the formation of the Hanseatic league of the continental cities; and the famous burgh laws date from about the same period. This code of Scotch burghal regulation," in Mr. Innes's opinion, "though collected in the reign of David, and sanctioned by him, was the result of the experience of the towns of England and Scotland;" and he goes on to show the very close resemblance between these laws and the burghal usages of Newcastle, and even of Winchester, which seems to suggest their common Saxon origin. Mr. Innes speaks favorably of the B. life of our ancestors; and he considers the burgh domestic architecture, of which monuments remain sufficient to show that "the burgess of the reformation period lived in greater decency and comfort than the laird, though without the numerous following, which no doubt gave dignity if it diminished food. I am not sure that this class has gone on progressively, either in outward signs of comfort, or in education and accomplishment, equal to their neighbors. The reason, I suppose, is obvious. The Scotch burgher, when successful, does not set himself to better his condition and his family within the sphere of his success, but leaves it, and seeks what he deems a higher." In confirmation of this view, Mr. Innes elsewhere mentions that "many of the old citizen-merchants of Edinburgh had studied at the university, and appear in the list of graduates."

Borough, in England, is properly a city or other town that sends burgesses to parliament—a privilege, the nature and extent of which will be explained under parliament (q.v.); and in this sense it is also called a *parliamentary borough*. But in the interpretation clause of the municipal reform act, 5 and 6 Will. c. 76, s. 142, the word *borough* is declared, for the purposes of the act, to mean a city, borough, port, cinque port, or town corporate, and whether sending representatives to parliament or not. See MUNICIPALITY.

BOROUGHBRIDGE, a t. in West Riding, Yorkshire, on the right bank of the Ure, here navigable for small craft, 17 miles n.w. of York. It arose simultaneously with the decline of Aldborough, 1¼ m. to the e., soon after the conquest, when the great north road was diverted from Aldborough to this place. Its chief trade is in agricultural produce and hardware. Pop. '71, 2508. Edward II., in 1321, defeated the

earl of Lancaster here. Near B. are three immense Druid stones, called the "Devil's Arrows," 16 to 22 ft. high.

BOROUGH ENGLISH is a custom that prevails in some ancient boroughs in England, according to which the youngest son inherits the property within borough in preference to his elder brothers. The reason assigned for it is, that the youngest son, on account of his tender age, is not so capable as his elder brothers to maintain himself. A posthumous son is entitled to this privilege, and dispossesses his elder brother. The right of representation also exists with reference to it, for should the youngest son die in his father's lifetime leaving a daughter, she will inherit the property. This custom obtains in the manor of Lambeth, Surrey, in the manors of Hackney, St. John of Jerusalem in Islington, Heston, and Edmonton in Middlesex, and in other counties. See CUSTOM, GAVELKIND, INHERITANCE.

BOROUGH FUND. This is a fund which is expressly defined by the municipal corporations act, 5 and 6 Will. IV. c. 76, by which it is declared that the rents and profits of all hereditaments, and the interest, dividends, and annual proceeds of all moneys, dues, chattels, and valuable securities belonging or payable to any body corporate named in conjunction with a borough in the schedules, or to any member or officer thereof, in his corporate capacity, and every fine or penalty for every offense against this act (the application of which has not been already provided for), shall be paid to the treasurer of such borough; and all the moneys which he shall so receive shall be carried by him to the account of a fund to be called "The Borough Fund;" and such fund, subject to certain payments and deductions, shall be applied towards the payment of the salary of the mayor, and of the recorder, police magistrate, town-clerk, treasurer, and other officers. Corporations may now, under certain checks, maintain parliamentary and legal proceedings at the expense of the borough fund, 35 and 36 Vict. c. 91. But existing gas and water companies authorized by statute are not to be competed with in this way.

The court of chancery exercises jurisdiction over the property of corporations in boroughs, which, since the municipal corporations act, are considered to hold their property in trust for charitable uses; and the trusts are applicable as well to the personal as to the real estate. See Grant on *Corporations*, 1850; and see FUND.

BOROUGH JUSTICES were first created in the time of Charles I. Under the municipal corporations act, 5 and 6 Will. IV. c. 76, these justices consist of the mayor during his year of office, and for one year after it determines; the recorder *ex officio;* and such persons as the crown may appoint by commission. Their duties cannot be delegated; and before acting, they must make the same declaration, and take the same oaths as the recorder does on entering his office. See JUSTICES.

BOROUGH LAWS, in Scottish legal history, was the name given to a collection of ancient laws relative to boroughs or *burghs*, which have long ceased to have any force, but serve to throw light on the ancient manners and customs of the country. The authenticity of these B. L. is beyond question; they are universally allowed to have been enacted in the reign of king David in the 12th century. See REGIAM MAJESTATEM.

BOROUGH RATE is a rate raised and levied within borough by order of the council of the same; and it has been decided by the court of exchequer that such rate is valid, though not made *in public*. By the 92d section of the municipal corporations act, 5 and 6 Will. IV. c. 76, where there is a deficiency of the *borough fund* (q.v.), the borough council is authorized and required from time to time to order a B. R. in the nature of a *county rate* (q.v.) to be made within their borough, for which purpose the council shall have all the powers of county justices. As to boroughs not within the municipal corporations act, the levying and application of borough rates in them is regulated by the 17 and 18 Vict. c. 71, by the first section of which it is enacted that the justices of the peace may make a B. R. in the nature of a county rate, for all the purposes for which a B. R. may be levied, such borough justices also having the same powers as county justices. The council of a borough cannot make a *retrospective* rate; and the provision of the 7 Will. IV. and 1 Vict. c. 81, s. 2, which declared lawful all such retrospective rates as might be made within six calendar months after the passing of the act, was merely for a temporary purpose. The municipal corporations act directs that all sums levied in pursuance of a B. R. shall be paid over to account of the borough fund; and there is a provision as to *watch rates* (q.v.).

Where parties consider themselves aggrieved by a B. R., they may appeal to the recorder at the next quarter-sessions for the borough; or if there be no recorder, to the next county quarter-sessions.

BOROVIT'CHI, a t. of Russia, in the government of Novgorod, 98 m. e. of the town of Novgorod, on both sides of the river Msta, near some rapids. Pop. '67, 9108. Its situation on the great canal and river water-way which connects the Volga with lake Ladoga, renders it of considerable commercial importance.

BOROVSK', or BOROFSK', a t. of Russia, in the government of Kalouga, and 49 m. n.n.e. of the town of that name. Conjointly with Kalouga it gives title to a bishop. It has extensive manufactures of sail-cloth, and a trade in leather, flax, and hemp. Its

onions and garlic are celebrated. In its vicinity is a convent, founded in 1444, one of the richest in the empire. Pop. '67, 8326.

BORROME'AN ISLANDS, a group of small islands in the Lago Maggiore, northern Italy. They are situated in the western arm of the lake, called the bay of Tosa, and are named after the family of Borromeo, which for centuries has been in possession of the richest estates in the neighborhood. They are sometimes also called *Isole dei Conigli*, on account of the number of rabbits found on them. They were little more than naked rocks, till Vitaliano, count Borromeo, master-general of ordnance to the king of Spain, about 1671, caused soil to be carried to them, built terraces, and converted them into gardens, the beauty of which and of their situation has won for them the name of the *Enchanted Islands*. The two most celebrated are *Isola Bella* and *Isola Madre*. On the w. side of *Isola Bella* stands a palace of the Borromeo family, containing many admirable paintings and other works of art. The *Salle terrene*, a series of grottoes, inlaid with stones of various colors and adorned with fountains, connect the palace with the gardens, the terraced style of which gives to the whole island the appearance of a truncated pyramid; a colossal winged unicorn, the armorial device of the Borromeo family, crowning the whole. *Isola Madre* is laid out in the same terraced style, and is crowned by a castle. The odors of flowers from the islands, upon which grow many plants of tropical climates, are wafted far over the lake. The *Isola de' Pescatori* now contains a village of about 400 inhabitants, who derive their subsistence from fishing and smuggling.

BORROMEO, CARLO, Count, a saint of the church of Rome, was b. on the 2d Oct., 1538, at the castle of Arona, on the Lago Maggiore, the family seat of his ancestors. He studied law at Pavia, and took the degree of doctor in 1559. His uncle, pope Pius IV., on being raised to the pontificate in 1560, appointed him, notwithstanding his youth, to a number of high offices, and made him a cardinal and archbishop of Milan. B. displayed great faithfulness and ability in governing Ancona, Bologna, and other parts of the states of the church as legate; and in discharging the duties of offices connected with ecclesiastical administration at Rome. Surrounded as he was with magnificence and luxury, he was always grave, pious, and rigid in his life, studious, and a patron of letters. His uncle, the pope, made him his grand penitentiary, and did nothing considerable without his co-operation. It was in a great measure by his influence that the re-opening of the council of Trent was accomplished, and that its deliberations were brought to a conclusion so favorable to the papal throne. He committed its decrees to memory, had the principal part in drawing up the *Catechismus Romanus* for exposition of them, and proceeded to give all possible effect to them in his archiepiscopal province. B.'s exertions, not only for the improvement of ecclesiastical discipline, but also for the reformation of morals in the archbishopric of Milan, drew upon him the hostility of the monastic orders, and also to some extent that of the Spanish authorities in Milan, who were jealous of the extension of his jurisdiction. An attempt was even made upon his life in 1569. He spent great part of his income in beautifying the cathedral and other churches. With a view to provide well-qualified priests, he founded, in 1570, the Helvetic college at Milan. He brought about an alliance of the seven Catholic cantons, known as the *Golden Borromean League*, for the united defense of their faith. In the famine of 1570, and during the plague in Milan in 1576, he displayed equal energy, benevolence, and devotedness, saving the lives of multitudes by the prompt arrangements which he made for necessary relief. Exhausted by his labors and his austerities, he died on 3d Nov., 1584. Many supposed miracles at his tomb led to his being canonized in 1616. His theological works were published at Milan in 1747, in 5 vols. folio. On the western bank of the Lago Maggiore, in the neighborhood of his birthplace, is a colossal brazen statue of him. His brother's son, count Frederico Borromeo, born 1563, was also a cardinal, and from 1595 to 1631 archbishop of Milan, and was the founder of the Ambrosian library (q.v.).

BORROW, GEORGE, an English author, b. at Norfolk in 1803. He displayed from his earliest years an extraordinary talent for languages, and a strong inclination for adventure. In his youth he lived for some time among gypsies, by this means acquiring an exact knowledge of their language, manners, and customs. His travels, as agent for the British and foreign Bible society, through almost all countries of Europe and a part of Africa, made him familiar with many modern languages, even to their dialectic peculiarities. Whatever was little known had peculiar charms for him, and he shrunk neither from toil nor danger. True to his youthful predilection, he made the gypsies scattered over every part of Europe one of the principal subjects of his study. His first work, *The Zincali, or an Account of the Gypsies in Spain* (2 vols., Lond. 1841), made a favorable impression by its lively and dramatic style. It was followed by *The Bible in Spain* (2 vols., Lond. 1843), a book to which its author is chiefly indebted for his celebrity, and which consists of a narrative of personal adventures as various as it is interesting. The graphic power of the style amply compensates for the rather unmethodical arrangement of the book. After a long interval, B. published a work long before announced, *Lavengro, the Scholar, the Gypsy, and the Priest* (3 vols., Lond. 1851), which was generally regarded as an autobiography, with a spice of fancy mingling with fact. The principal character is depicted with extravagant exaggeration; and the somewhat bizarre originality which gave a peculiar zest to the author's earlier works here appears as man-

nerism. The book left the hero in the midst of his adventures, which were not continued until 1857, when B. published *The Romany Rye*, a sequel to *Lavengro*, which was a more unsatisfactory work than any of its predecessors. He published *Wild Wales* in 1862, and *Romano Lavo-Lil* in 1874.

BORROWING has, in the case of *money*, several legal applications of a general nature, in which the law with regard to *bonds*, *mortgages*, and other similar *securities*, has to be considered. See the articles on these subjects. More strictly, borrowing may be described as a contract under the law of *bailments* (see CONTRACT), and may be briefly and simply defined as asking or taking a loan. The essentials of this contract are, that there must be a certain specific thing lent, such as a book, an article of furniture, a horse, or it may be a house, land, or even an incorporeal right. But in the law of England the contract is confined to goods and chattels or personal property, and does not extend to real estate. Lord chief-justice Holt's definition described it as a borrowing of a thing *lent*, in contradistinction to a thing deposited, or sold, or intrusted to another for the sole benefit or purposes of the owner. Again, the borrowing must be gratuitous and for the borrower's use, which use must be the principal object, and not a mere accessory. Such use, too, may be for a limited time or for an indefinite period. The contract must also be of a legal nature, for if it is immoral, or against law, it is utterly void; this, however, is a necessary qualification of all contracts. Lastly, the property which is the subject of the contract must be borrowed or lent to be *specifically* returned to the lender at the determination of the agreement, in which respect it differs from a loan for consumption.

The persons who may borrow and lend are all those who can legally make a contract; a capacity, therefore, which excludes married women, unless they act with the consent of their husbands, when it binds the latter and not the wives.

It is not necessary that the lender should be absolute proprietor of the thing lent or borrowed; it is sufficient if he have either a qualified or a special property therein, or a lawful possession thereof. As to the borrower, he has the right to use the thing during the time and for the purpose intended, whether such intention is expressed or implied; but beyond this he cannot go. The following quotation from Mr. Justice Story's celebrated work on *bailments* (to which reference is generally made), is useful for popular information: "A gratuitous loan is to be considered as strictly personal, unless, from other circumstances, a different intention may fairly be presumed. Thus, if A lends B her jewels to wear, this will not authorize B to lend them to C to wear. So, if C lends D his horse to ride to Boston, this will not authorize D to allow E to ride the horse to Boston. But if a man lends his horses and carriage for a month to a friend for his use, there, a use by any of his family, or for family purposes, may be fairly presumed; although not a use for the benefit of mere strangers." During the period of the loan, the borrower has no property in the thing, but a mere right of possession and use of it. But, notwithstanding, if the thing lent and borrowed be injured by a stranger, it would appear that the borrower may maintain an action for the recovery of damages; the mere possession of property without title being sufficient against a wrong-doer. See CONTRACT, LOAN, HIRE, besides the subjects above referred to.

BORROWING DAYS. The last three days of March are so called in Scotland and some parts of England. The popular notion is, that these days are borrowed or taken from April, and may be expected to consist of cold or stormy weather. Although this notion dates from a period before the change of the style, a few days of broken and unpleasant weather about the end of Mar. still afford a sanction for old notions concerning the borrowing days. The origin of the term B. D. is lost in the mists of antiquity, though we are inclined to hazard the conjecture that it has no higher source than the popular rhyme in which it is introduced as a poetic fiction. The most dramatic form of this rhyme in Scotland is as follows:

March said to April:
"I see three hoggs on yonder hill;
And if you'll lend me days three,
I'll find a way to gar [make] them die!"
The first o' them was wind and weet,
The second o' them was snaw and sleet,
The third o' them was sic a freeze,
It froze the birds' feet to the trees.
But when the borrowed days were gane,
The three silly hoggs came hirplin [limping] hame.

The superstition, if we may so call it, respecting the B. D., though now little else than a jocular fancy, was so strong in Scotland in the 17th c., that when the Covenanting army, under Montrose, marched into Aberdeen on the 30th Mar., 1639, and was favored by good weather, a minister pointed it out in his sermon as a miraculous dispensation of Providence in behalf of the good cause. See Gordon of Rothiemay's *History of Scots Affairs from* 1637 *to* 1641. For further notice of the B. D. we refer to Brand's *Popular Antiquities*.

BORROWSTOUNNESS', or BONESS', a seaport in Linlithgowshire, on a low peninsula on the firth of Forth, 17 m. w.n.w. of Edinburgh. It has coal-mines extending under the bed of the firth; and manufactures of salt, soap, malt, vitriol, and earthenware, and a trade in grain. Ironstone, limestone, and freestone also exist in the parish. Graham's dike, a part of the Roman wall of Antoninus, traverses the parish. Dugald Stewart

lived near Borrowstounness. Pop. '71, 4986. In 1875, there were registered as belonging to B. 26 vessels of 3881 tons. In the same year, 993 vessels, of 123,595 tons, entered the port, and 2080, of 245,675 tons, cleared it.

BORSA, a village in Hungary, 50 m. s.e. of Szigeth; pop. '69, 5503. There are mines of gold, lead, and copper in the neighborhood.

BORSAD, a t. in the n. division of the province of Bombay, in the district of Kaira. It is situated in the elevated region of Gujerat, 1900 ft. above the sea level, and is connected by railway with Bombay and Baroda. Pop. '72, 12,214.

BORSIPPA, mentioned by Strabo as a city of Babylonia, sacred to Apollo and Diana, supposed to have been near Babylon. Recent writers have suggested that the mound Birs-Nimrod may be on the site of the old city, but this cannot be held as confirmed.

BORSOD, a co. in Hungary, on the Theiss; 1370 sq.m.; pop. '70, 195,037. The soil is productive, and the co. is famous for wheat and other grain, and for cattle. Grapes are extensively cultivated. There is considerable mining, and plenty of game. Co. seat, Miskolcz.

BORY DE SAINT VINCENT, JEAN BAPTISTE GEORGE MARIE, a French traveler and naturalist, was b. in 1780 at Agen, now in the department of Lot-et-Garonne. In 1798, he proceeded, along with capt. Baudin, in a scientific mission to New Holland, but separated from him before they reached their destination. On his return he wrote his *Essai sur les Iles Fortunées de l'antique Atlantide* (Par. 1803); and his *Voyage dans les quatre principales Iles des Mers d'Afrique* (Par. 1804). Having joined the army, he served at Ulm and Austerlitz, and on Soult's staff in Spain. He served as a col. at Waterloo, and afterwards had to retire to Belgium. At Brussels he edited, along with Van Mons, the *Annales des Sciences Physiques* (8 vols.). He also produced an admirable work on the subterranean quarries in the limestone hills near Maestricht (Par. 1821). He returned to France in 1820, wrote for liberal journals, and for Courtin's *Encyclopédie*, etc. In 1827, appeared his *L'Homme, Essai Zoologique sur le Genre humain*. He wrote what relates to cryptogamic plants in Duperrey's *Voyage autour du Monde* (Par. 1828). He rendered an important service to science by editing the *Dictionnaire Classique de l'Histoire Naturelle*. When, in 1829, the French government sent a scientific expedition to the Morea and the Cyclades, the first place in it was assigned to B. de S. V.; and the results of his researches were given to the world in the *Expédition Scientifique de Morée* (Par. and Strasb. 1832, etc.), and in the *Nouvelle Flore du Péloponnèse et des Cyclades* (Par. 1838). In 1839, he undertook the principal charge of the scientific commission which the French government sent to Algeria. He died 22d Dec., 1846.

BORYSTHENES. See DNIEPER, *ante*.

BORZ'NA, a t. of Russia, in the government of Tchernigov, 50 m. s.e. of the town of Tchernigov. Pop. '67, 8129.

BOS. See BOVIDÆ and OX.

BOS, LAMBERT, a Dutch philologist, was b. at Workum, in Friesland, 23d Nov., 1670, and studied at the university of Franeker, where, by the advice of Vitringa, he devoted himself especially to the Greek language. In 1704, he was appointed Greek professor in that university. He died 6th Jan., 1717. All his works are characterized by thorough scholarship and remarkable acuteness, and notwithstanding the advances of classical criticism since his day, some of them are still consulted, such as his *Vetus Testamentum ex Versione Septuaginta Interpretum* (Franeker, 1709; new edit., Oxford, 1805), his *Ellipses Græcæ* (Franeker, 1702), and more particularly his *Antiquitatum Græcarum præcipue Atticarum Descriptio Brevis* (Franeker, 1714).

BOSA, a t. of the island of Sardinia, in the province of Cagliari, near the mouth of the Termo. Lat. 40° 17′ n., long. 8° 27′ east. Notwithstanding its fine situation, partly on the side of a hill, and partly on a plain, it is an unhealthy place. It is surrounded by decaying walls; has an old castle, a cathedral, several monasteries and churches; and a trade in wine, oil, grain, and cheese. Its port admits only vessels of small size. Pop. 6500.

BOSC, LOUIS AUGUSTIN GUILLAUME, 1759–1828; a French naturalist who visited the United States in 1796 and practically studied American natural history. He traveled in Italy, wrote much on natural history, was professor in the Versailles zoological garden, and member of the academy. He was tutor to Mlle. Roland, and adopted her as his daughter, recovering for her the confiscated property of her family. He was the author of a history of the wine district of France, and several well-known works on natural history.

BOSCAN-ALMOGA'VER, JUAN, a Spanish poet, b. in the year 1500 at Barcelona, of an ancient noble family. He received from his parents a careful education, and came to Granada, to the court of Charles V. The education of the celebrated duke of Alva was afterwards intrusted to him. He spent the latter part of his life at Barcelona, and was employed in editing his own works and those of his friend Garcilasso de la Vega, when he died some time prior to 1544. He was the first to make use of Italian measures in Spanish verse, and thus became the creator of the Spanish sonnet. By the introduction

of various Italian forms, he made an epoch in Spanish poetry. His poems are still esteemed, but his other literary productions are forgotten. The best edition is that of Leon, 1549.

BOSCAW'EN, EDWARD, an eminent English admiral, second son of viscount Falmouth, was b. in 1711, and highly distinguished himself at the taking of Puerto-Bello, and at the siege of Carthagena in 1740. In April, 1744, he captured the French ship *Medée*, with 800 prisoners. He had an important share in the victory off cape Finisterre (May 3, 1747), and six months after received the command of the East Indian expedition; he displayed high military skill in conducting the retreat from Pondicherry. He returned in 1750, and in the following year became a lord of the admiralty. In 1755, he was again afloat, and intercepted the French fleet off Newfoundland, capturing two 64-gun ships and 1500 men, including the French commander, Hoquart, whom he had twice before taken prisoner. Next year, now admiral of the blue, he was appointed commander-in-chief of the powerful expedition against cape Breton, as the fruit of which that island and St. John's were taken after some hard fighting. B. crowned his career by his signal victory over the French Toulon fleet, in the bay of Lagos, Aug. 18, 1759. On his return home, he received the thanks of parliament, a pension of £3000 a year, a seat in the privy council, and the command of the marines. In the following summer, while his fleet lay idle in the bay of Quiberon, ravaged by scurvy, B. and some of his men employed themselves in cultivating a garden on a small island, in order to supply the sick with vegetables. He died in the following year. Lord Chatham is said to have testified that when he proposed expeditions to other commanders he heard only of difficulties, but when he applied to B., he found him ready with suggestions and expedients.

BOSCH, HIERONYMUS DE, b. at Amsterdam, 23d Mar., 1740, d. there 1st June, 1811; was unquestionably the most distinguished Latin poet of recent times, and a philologist of varied acquirements. His *Poemata* first appeared at Leyden in 1803 (2d ed. Utr. 1808). He rendered an important service to classical literature by his edition of the *Anthologia Græca*, with a metrical translation by Hugo Grotius, never before published (4 vols. Utr. 1795–1810, to which Van Lennep added a fifth volume, Utr. 1822). His discourses and treatises on subjects of literature, which are mostly composed in the Dutch language, display profound learning, excellent judgment, and refined taste.

BOSCH-BOK, an antelope of s. Africa, found chiefly in almost impenetrable thickets. It is timid, and easily caught in the open country, and its flesh is much valued. It is from 4 to 5 ft. long, and makes a sound like the barking of a dog.

BOSCH-VARK, a wild hog in s. Africa, nearly the same in form and habits as the domestic hog, but with long pointed ears and a long tail. These animals live in herds, and the boars make dangerous fight with their tusks.

BOSCOBEL, an extra-parochial liberty of England, in the co. of Shropshire, about 6 m. e.n.e. of Shiffnal. The population of B. is only about 20, but the place is interesting in connection with the escape of Charles II. after his defeat at Worcester, in 1651. After the battle, Boscobel house being proposed as a secure retreat, thitherwards Charles turned his steps. At White-Ladies, a seat of the Giffard family, which was reached in the early morning, the king had his long hair cut, his hands and face smeared with soot, and for his royal dress he substituted the green and greasy suit of a countryman, and a leathern doublet. Thus disguised, Charles passed through a secret door into a neighboring wood, in the thickest part of which he sat shivering in the rain until dusk, when he stole out, and along with a guide endeavored to reach Wales, where it was now thought he would be safer than at Boscobel. They reached a royalist's house at Madeley, on the banks of the Severn, at midnight, and it was then found that they could not escape to Wales, on account of the vigilance of the Puritans; and once more, after a day's rest in a stable loft, the king started for Boscobel wood, where he arrived about 5 o'clock in the morning. He immediately, along with maj. Carlis, who had led the forlorn hope at Worcester, ascended a thick pollard oak, from which they could watch at intervals during the day the roundheads in search of them passing by unaware of their near presence. In the evening they descended from their elevated hiding-place, and made their way to the manor-house, where the king remained hidden for two days. After other adventures, Charles contrived to escape from England on the 17th Oct.—The title of BOSCOBEL TRACTS has been given to certain contemporaneous writings, first published in 1662, giving a graphic description of this passage of the monarch's life. The authorship is generally attributed to Thomas Blount, a loyal gentleman of Worcestershire; but Nash, his grandson, in his history of Worcestershire, denies that they were his, on the authority of Blount himself. But the author, whoever he was, was manifestly a stanch royalist, and his narrative bears evidence that he had good opportunity for ascertaining the truth of all the statements in it.

BOSCO REALE, a t. of s. Italy, in the province of Naples, at the s. base of Mount Vesuvius, 10 m. e.s.e. of Naples city. It contains several churches and convents. Pop. 4553. Good wine is produced in the neighborhood, and much silk. This town was in imminent danger of destruction by the eruption of Vesuvius in 1850, when a stream of lava advanced towards it with a front of about a mile and a half broad, and a depth of

about 12 ft., enveloped the town, and consumed the wood on both sides of it, in which were many magnificent oak, ilex, and ash trees. The larger trees, as they were enveloped in the lava, poured out jets of hissing steam from every knot and branch, and then exploded with a loud noise, leaping into the air to the height of 10 or 20 feet.

BOSCO TRE-CASÈ, a t. of Italy, situated at the southern base of Mount Vesuvius. It has several churches and convents, and a royal manufactory of arms and gunpowder. Wine and silk are raised in the district. Pop. 2500.

BOSCOVICH, ROGER JOSEPH, a celebrated mathematician and astronomer, b. at Ragusa, 18th May, 1711. He entered at an early age into the order of the Jesuits, and spent his life in scientific pursuits and important public labors. Before the completion of his course of studies in Rome, he was appointed teacher of mathematics and philosophy in the *Collegium Romanum* there. The pope gave him a commission to measure a degree of the meridian in the states of the Church, which he accomplished in the years 1750-53. In 1764, he was appointed to a professorship in Pavia, but after some time retired from this office. He was subsequently appointed professor of astronomy and optics in the palatine schools at Milan, and superintended the erection of the observatory in the Brera college, upon which he spent money of his own. After the dissolution of his order, he went to Paris, in 1774, and received a pension from the king. B. afterwards went to Bassano, to superintend an edition of his works, on the completion of which he returned to Milan, but fell into a depression of spirits; which at last grew into complete insanity, and he died 12th Feb., 1787. His works include dissertations on a great variety of important questions in mathematical and physical science, and were published collectively under the title *Opera Pertinentia ad Opticam et Astronomiam* (5 vols., Bassano, 1785). His name is connected with a theory of physics, first published in his *Philosophiæ Naturalis Theoria, Redacta ad Unicam Legem Virium in Natura Existentium* (Vienna, 1758). He was also a poet, and his Latin poem *De Solis ac Lunæ Defectibus* (Lond. 1764), has been much admired.

BOSIO, FRANÇ. JOS., Baron, an eminent sculptor, was b. 1769, at Monaco, in Sardinia; studied at Paris; and when only 19, returned to Italy, where he executed a multitude of commissions even at that early age. His reputation was greatly increased by the figures which, at the request of Napoleon, he executed for the column in the Place Vendôme. Louis XVIII. and Charles X. also patronized B., the former appointing him royal sculptor, the latter elevating him to the rank of baron. He also enjoyed several professional honors, being director of the academy of fine arts in Paris, and member of the Berlin academy of arts. He d. July 29, '45. B.'s principal works are—the "Hercules" in the garden of the Tuileries; the incomparably beautiful "Hyacinth" in the Luxembourg; the "Nymph Salmacis," a figure displaying wonderful grace and purity of outline; an allegorical figure of France, 7 ft. high, surrounded by the muse of history and a group of genii; the statue in memory of the Duc d'Enghien; the equestrian statue in the Place des Victories, and the monument of count Demidov, 30 ft. high, composed of 6 figures, with bass-reliefs, etc. Besides these, B. executed a great multitude of busts of distinguished persons, such as the emperor Napoleon, the empress, queen Hortensia, the king and queen of Westphalia, Louis XVIII., Charles X., etc. B.'s works are all marked by grace of form, harmony of design, and elegance of finish. His style generally reminds one of Canova.

BOSJESMAN'S COUNTRY, a region in Africa to the n. of the Cape colony. The inhabitants, a variety of the Hottentot (q.v.) race, are remarkably diminutive in stature, and thoroughly savage in condition.

BOSNA-SERAI', SERA'IO, or SARAJE'WO (Ital. Seraglio), capital of the province of Bosnia, is beautifully situated in the midst of gardens on both sides of the Migliazza, an affluent of the Bosna, about 122 m. s.w. of Belgrade. Its pop. is estimated at 50,000, of whom the majority are Christian Bosniaks, the others Moslems and Jews. Four handsome stone bridges cross the river at different points of the city, which is adorned with many churches and mosques (among them a Christian cathedral), whose gilded domes and whitened minarets and spires give it quite an oriental appearance. B. has a palace built by Mohammed II., and an old castle on a height, erected in 1263 by the Hungarian gen. Cotroman; its old walls are decayed, and it is now of no military importance. B. has manufactures of tin, iron, and copper goods and trade in dyeing. Its position makes it an important commercial entrepot, and it is consequently a busy place. It has also valuable iron mines and mineral baths in the vicinity. The city was taken and occupied by the Austrians after a sharp engagement in Aug., 1878.

BOS'NIA, till 1878 a Turkish vilayet, now a province of the Ottoman empire occupied and administered by Austria. Till 1876 it also included Herzegovina (q.v.), and still comprises the hitherto Turkish parts of Croatia and Dalmatia. It is bounded n. by the Save and Unna; e. by the Vrina, the mountain chain of Jublanik, and a branch of the Argentaric Alps; s. by the Scardagh mountains; and on the w. by the mountains of Cosman, Timor, and Steriza. At a few points in the s. it reaches to the Adriatic sea. Area, 20,000 sq. miles. Pop. '79, near 1,000,000; about ¾ Christians, Moslems, and the rest Jews. With the exception of the northern tract, extending along the Save, it is everywhere a mountainous country, and is traversed by more or less elevated ranges of

the Dinaric Alps, whose highest peaks rise to a height of from 5000 to 7700 ft. above the sea, and are covered with snow from Sept. to June. The mountain slopes are for the most part thickly covered with forests of oak, beech, lime, chestnut, etc., of magnificent growth, and only here and there exhibit meadows, pastures, and cultivated spots. The principal river of the country is the Save, on the northern border, into which flow the Unna, the Verbas, the Bosna, and the Drin. The Narenta and the Boyana fall into the Adriatic sea. The air is salubrious, the climate temperate and mild. It is only in the plain that agriculture is carried on to a considerable extent; grain, maize, hemp, vegetables, fruits, and grapes are produced in great abundance; and their cultivation would be much more extensively and actively prosecuted but for the heavy impositions laid upon this branch of industry by the Turkish government. Game and fish abound, as well as wild animals, such as bears, wolves, lynxes, etc. The country is celebrated for the breeding of sheep, swine, goats, and poultry; and bees, both wild and tame, are very numerous. The gypsies and Morlacks dig for lead, quicksilver, coal, and iron; but beyond this, mining, owing to repressive government, is entirely neglected, although the country is rich in metallic ores. Commerce and manufactures—chiefly limited to the fabrication of fire-arms, saber-blades, and knives—are entirely confined to the towns. The position of B. gives it the transit trade between Austria and Turkey. It has almost no good roads. The population consists of Bosnians, Croats, Morlacks, Montenegrins, Turks, etc., the much greater part being of the Slavonian race. The Bosnians, or Bosniaks, who form about a third of the inhabitants, are partly Mohammedans (descendants of Slavonian Christians who changed their religion at the time of the Mohammedan conquest), and partly of the Greek and Roman Catholic churches. They are brave, hardy, rapacious, and cruel; rude and repulsive toward strangers, yet among themselves they are peaceful and honest; they are also industrious, simple in their habits, and temperate. The Moslem women in B. are less secluded than in the other Turkish provinces, and have long enjoyed the liberty of appearing in public more or less veiled. The Croats, who form about a sixth of the population, belong partly to the Greek and partly to the Roman Catholic church; only a few are Mohammedans. They are principally engaged in agriculture, the feeding of cattle, and the barter trade. The Morlaks, who number about 150,000, dwell mostly in the district of Herzegovina, and are courteous and clever in business. They are inveterate enemies of the Turks. Three fourths of them are Greek Christians, and the rest Roman Catholics. The Osmanli Turks in B. are but about 2000 in number; the number of Grecks and Jews is between 20,000 and 30,000. B. being a frontier province, is important as a line of defense, and has consequently a great number of fortifications. B., in ancient times, was included in Pannonia; and previous to the 7th c. was governed by princes of its own, called bans or woiwodes, who became dependent on Hungary. Being conquered by the Turks, it was finally annexed to the Ottoman empire in 1522. B. has frequently been the seat of political disturbance. A dangerous rebellion broke out in 1851. The insurrection which originated in Herzegovina in 1875, soon assumed the proportions of a national movement, and led to war between Turkey and Servia and Montenegro. The war of 1877–78 between Russia and Turkey followed; the treaty concluded at the close of it proposed to give B. administrative autonomy, but the Berlin conference of 1878 resolved that B. should be occupied and administered by Austria.

BOSPORUS, commonly but erroneously spelt *Bosphorus*, the ancient name of the channel which separates Europe from Asia, and connects the Black sea with the sea of Marmora. The name, which signifies ox-ford or cow-ford, was given to it because here, according to the legend, Io, transformed into a cow, swam across; or, as is very generally supposed, because it is so narrow that an ox might swim across. Afterwards, as the same name was bestowed upon other straits, this was designated the *Thracian Bosporus*. Its s. and n. entrances have two light-houses each. Its shores are elevated, and throughout its length the strait has seven bays or gulfs, with corresponding promontories on the opposite side. One of these gulfs forms the harbor of Constantinople, or, as it is often called, the Golden Horn. The length of the Thracian B. is about 17 m., with a breadth of from little more than a third of a mile to 2 miles. At the middle of this strait, where it it is about 2800 ft. in breadth, Darius made his bridge of boats when he marched against the Scythians. The B. has long been under Turkish control. Repeated European conferences, including that of Berlin in 1878, have confirmed the stipulation of the treaty made in 1841, providing that no ship of war belonging to any nation but Turkey shall pass the B. without the consent of the Ottoman authorities.

The name of CIMMERIAN BOSPORUS was given by the ancients to the strait of Kaffa (q.v.), also called the strait of Yenikalé or of Theodosia. The country on both sides of the Cimmerian B. formed, in ancient times, the kingdom of Bosporus, which was founded in 502 B.C. In 393, the kingdom was extended along the Asiatic coast; and Theodosia was united with it in 360. The kingdom became tributary to the Scythians in 290; and in the year 116 B.C., Mithridates, king of Pontus, vanquished the Scythians, and set his son, Machares, on the throne of Bosporus. On the death of Machares, soon followed by that of Mithridates, the Romans gave the country, in 63 B.C., to Pharnaces, the second son of Mithridates, and after his assassination, to several princes who gave themselves out for descendants of Mithridates. When at last the family became entirely

extinct in 259 A.D., the Sarmatians made themselves masters of the kingdom, from whom the inhabitants of the Chersonesus took it in 344. Along with Tauric Chersonesus, it after wards formed a part of the eastern Roman empire, until the Chazars, and afterwards the Tartars, under Mongolian princes, made themselves masters of it. See TAURIDA.

BOSQUE, a co. in n. Texas, on the Brazos, watered by Bosque river; 905 sq.m.; pop. '70, 4981—528 colored. It has an undulating surface, a fertile soil, with forests of oak and cedar. Co. seat, Meridian.

BOSQUET, PIERRE FRANÇOIS JOSEPH, a distinguished French marshal, b. 8th Nov., 1810, at Mont de Marsan, in the department of Landes, entered, in 1829, the polytechnic school at Paris, and in 1833 joined the artillery as sub-lieut. In June, 1834, he proceeded with his regiment to Algeria, where he became conspicuous for his military tact, energy, and valor. In 1847, he had attained the rank of col., and the following year he was named gen. of brigade by the republican government. In the end of 1853, he returned to France, and in 1854 was appointed by the emperor gen. of division. He had the command of the second division of the French army in the Crimea, and at the battle of the Alma, 20th Sept., his successful maneuvers against the Russian left wing were mentioned in marshal St. Arnaud's dispatch to the emperor as deciding the fate of the day. At Inkerman, 5th Nov., he contributed greatly to the defeat of the Russians. His conduct on this occasion was noticed with praise by lord Raglan in his dispatch, and the British parliament voted its thanks to him in a special resolution. He also took a leading part in the capture of the Malakoff, 8th Sept., 1855; but a wound he received from the bursting of a shell obliged him to retire to France. In 1856, he was made field-marshal. He died in 1861.

BOSS, in architecture, a raised ornament, covering the intersections of the ribs of ceilings. They are more frequently seen in vaulted roofs, as in the aisles of a church, but occur also where the ceiling is flat. In early Norman work there are generally no bosses, and they become richer and more frequent as we advance towards the decorated and perpendicular styles. In the decorated style the B. usually consists of foliage, sometimes combined with animals, heads, and the like. Coats-of-arms, charged with armorial bearings, came then also to be used for this purpose, though they were more frequent in the perpendicular.—The B. of a bit is the ornament with which a bridle-bit terminates at each end. It was borne in the arms of the corporation of Lorimers. See LORIMER.

BOSSAGE, a stone in a building left rough and projecting, afterwards to be worked into a decoration. Bossage is applied, in France, to rustic work in which stones advance beyond the general face or level of the structure.

BOSSI, GIUSEPPE; 1776–1816; an Italian painter and writer on art. He studied at Milan and at Rome, and was secretary of the Milan academy. When Napoleon was in Milan in 1805, B. exhibited a drawing of Michael Angelo's "Last Judgment," and pictures representing "Aurora and Night," "Œdipus and Creon," and the "Italian Parnassus." B. also made a copy of Leonardo's "Last Supper," the original being then almost obliterated, and from his copy a mosaic was executed by Raphael, and placed in the imperial gallery at Vienna. Another copy, made in oil, was placed in the Brera museum. Much of B.'s life was devoted to the study of the works of Leonardo, and his last work was a series of drawings representing incidents in the life of that master. He left unfinished a large cartoon in black chalk of "The Dead Christ in the Bosom of Mary, with John and the Magdalene." He also published a special volume on Leonardo, and other books on art. There is a monument by Canova to B.'s memory in the Ambrosian library.

BOSSI, GIUSEPPE CARLO AURELIO, Baron de, 1758–1823; an Italian diplomatist and poet. When only 18 years old, he published two tragedies, and at 22 became a doctor of laws. He served as secretary of state for foreign affairs, and in a diplomatic capacity in Berlin, St. Petersburg, and Venice. He was envoy to Bonaparte, member of the Sardinian provisional government, and deputy to petition for annexation to France. In 1801, Napoleon made him a baron and prefect of La Manche. Among his poems and lyrics is one entitled "Independenza Americana."

BOSSI, LUIGI, an Italian archæologist and historian, was born at Milan in Feb., 1875; studied at Pavia, and became a canon of the cathedral of Milan; but when the French entered Italy, he took the side of the invaders, and was appointed by Bonaparte agent of the French government at Turin, and afterwards prefect of the archives of the kingdom of Italy. He died at Milan 10th April, 1835. He was an extremely prolific author, and produced more than 80 works, great and small, including theological and religious works, dissertations on antiquarian subjects, historic works, works on subjects connected with the fine arts, tragedies, comedies, etc. That his works have afforded many opportunities for unfavorable criticism, is only what might be supposed, from their number and variety. His *Introduzione allo Studio delli Arti del Disegno*, is instructive and much esteemed. His most important historic works are a much enriched translation of *Roscoe's Life of Leo X.* (12 vols., Milan, 1816–17); *Researches concerning Christopher Columbus* (Milan, 1818); and a *History of Italy* (19 vols., Milan, 1819–23).

BOSSIER, a parish in n.w. Louisiana, on Red river; 800 sq.m.; pop. '80, 16,045—3505 colored; chief productions, corn and cotton. Co. seat, Bellevue.

BOSSU, RENE, LE, 1631–80; a French critic. He was professor in different religious houses for twelve years, but thenceforth he devoted his time to authorship. His first publication was on Aristotle's *Physics*. He afterwards wrote a *Treatise on the Epic Poem*, extravagantly praised by Boileau, in which he held that the subject should be chosen before the characters, and the action organized without reference to the persons who are to carry it on.

BOSSUET, JACQUES BÉNIGNE, a distinguished French pulpit orator, was b. 27th Sept., 1627, at Dijon; received his earlier education in the Jesuit college there; and then came to Paris to the college of Navarre, where he studied the sacred Scriptures, the works of classical antiquity, and the Cartesian philosophy. In 1652, he was made a doctor of the Sorbonne, and a canon in Metz. Here he was called by the bishop to reply to the catechism of the Protestant minister, Paul Ferri, and this he did in a way that commanded the admiration even of Protestants. He soon attained great distinction as a pulpit orator, and in 1661 he was made preacher to the court. His discourse on the occasion of marshal Turenne's conversion to the Catholic church obtained for him the bishopric of Cordan. The king having, in 1670, intrusted to him the education of the dauphin, he resigned his bishopric in 1671, because he believed that he would be unfaithful to his duty if he retained it during a continued absence from his diocese. He was now made a member of the academy. The care with which he attended to the education of the dauphin was rewarded, in 1680, by his nomination as first almoner of the dauphin, and in 1681 by his appointment to the bishopric of Meaux. He was the author of the four articles which secured the freedom of the Gallican church, and the rights of the king in regard to it, against the aggressions of the pope; and his eloquence in the assembly of the French clergy, in the year 1682, obtained their adoption of these articles. In 1697, he became a member of the council of state, and in the following year first almoner to the duchess of Burgundy. He spent the last year of his life in his diocese, where he died 12th April, 1704. He was alike strict in morals and in religious doctrine: his strictness in the latter he showed particularly in his controversy with Fénélon (q.v.), whom he accused of heresy for his defense of the Quietists (q.v.). His style is vigorous and artistic. His orations at the funerals of the duchess of Orleans and the great Condé are particularly noted as masterpieces of this kind of eloquence. All his writings attracted much attention. For the defense of those dogmas of the Catholic church which are rejected by Protestants, he wrote his *Exposition de la Doctrine de l'Eglise Catholique sur les Matières de Controverse* (Par. 1671). His greatest controversial work is his celebrated *Histoire des Variations des Eglises Protestantes* (2 vols., Par. 1688), in which he founds his argument chiefly upon the doctrinal diversities of the churches of the reformation. To the defense of the four articles of the Gallican church he devoted his *Defensio declarationis celeberrimæ, quam de Potestate Ecclesiæ sanxit clerus Gallicus a.* 1682 (2 vols., Luxemb. 1730). With a view to the instruction of the dauphin, he wrote his *Discours sur l'Histoire Universelle jusqu'à l'Empire de Charlemagne* (Par. 1681), a work particularly deserving of notice, as the first attempt at a philosophical treatment of history. The continuation of it to the year 1661 (Par. 1805) is entirely derived from materials which he left behind him, but to which the last touch of his own hand was wanting. Another fruit of his political and historical studies was the *Politique tirée de l'Ecriture Sainte* (Par. 1709). The most complete edition of his works is that published under the care of the Benedictines (46 vols., Versailles, 1815–19).—His nephew, JACQUES BOSSUET, died bishop of Troyes, 12th July, 1743. His very extensive correspondence, chiefly devoted to the elucidation and investigation of the views of Fénélon, is included in the above-mentioned edition of the works of his uncle.

BOSSUT, CHARLES, a French mathematician and natural philosopher, b. 11th Aug., 1730, at Tartarus, near Lyons. So early as the year 1752, he became professor of mathematics in Paris, and in 1768 was received into the academy of sciences. The revolution deprived him of his situation and his income, and he lived in the greatest seclusion, and in almost misanthropical discontentment, till under the empire he was appointed a professor in the polytechnic school. He died 14th Jan., 1814. His works are very numerous. The following may be mentioned as particularly valuable: *Recherches sur la Construction la plus avantageuse des Digues* (Par. 1764); *Recherches sur les Altérations que la résistance de l'éther peut produire dans le Mouvement des Planètes* (Par. 1776); *Nouvelle Expérience sur la Résistance des Fluides, par d'Alembert, Condorcet, et Bossut* (Par. 1777); *Traité élémentaire de Mécanique et de Dynamique* (Charleville, 1763); *Cours Complète des Mathématiques* (7 vols., Par. 1795–1801); *Cours de Mathématique à l'Usage des écoles Militaires* (2 vols., Par. 1782); *Essai sur l'Histoire Général des Mathématiques* (2 vols., 2d ed., Par. 1810), one of the best works on the history of mathematics; and *Traité du Calcul Différentiel et Intégral*. All his works are distinguished by methodical arrangement and great clearness. He was a great admirer of Pascal, and edited his works (15 vols., Par. 1779), to which he prefixed an introductory *Discours sur la Vie et les Ouvrages de Pascal*, in 5 vols.

BOSTAN', (EL), a t. in Asiatic Turkey, in the pashalic of Marash, situated in a plain on the Sihun, on the n. side of Mount Taurus. Lat. 38° n., long. 36° 23′ east. B. can

be surrounded with water on the approach of an enemy; it has several mosques, and a considerable trade in wheat. It occupies the site of the Cappadocian Comana, which had a celebrated temple dedicated to a deity which is "supposed to have been called *Ma* in the language of the country, and to be the moon-goddess." Pop. between 8000 and 9000.

BOSTANJI, a class of men in Turkey who, originally the sultan's gardeners (the name being derived from *bostan,* a garden), now perform, in addition to their garden labor, a variety of duties, such as mounting guard at the seraglio, rowing the sultan's barge, and attending on the officers of the imperial household. They are under a chief called Bostanji Bashi, who holds the rank of a pasha, and is governor of the sultan's residences, and steersman of his barge. He also holds the inspector-generalship of the woods and forests in the vicinity of the capital, has the jurisdiction of the shores of the Bosporus and sea of Marmora, and is, altogether, so important a functionary that only personal favorites of the sultan can hope to fill the office. The financial reforms of sultan Mahmoud, however, have greatly lessened the emoluments of the post. The B. at one time amounted to 5000, and were divided into companies, like the janissaries, with whom they were united in military duty. In war-time, their strength was 12,000. A scarlet bonnet, of excessive dimensions, formed the distinctive part of their costume. Their number now does not amount to more than 600.

BOSTON, an ancient English borough and seaport in Lincolnshire, on both sides of the Witham, 28 m. s.e. of Lincoln. It is supposed to be identical with the Icanhoe, where St. Botolph founded an abbey in 654, destroyed in 870 by the Danes. Under the Normans, B. became a place of importance, and in 1204 it paid the largest dues (£780) of any English port except London (£836). In the reign of Edward III., many foreign traders settled, and the merchants of the Hanseatic league established a guild in Boston. After their departure, the town declined, and the suppression of the monasteries by Henry VIII. further injured it; but his grant of a charter of incorporation, and Mary's subsequent grant of extensive lands, partly compensated for this. The modern town consists chiefly of two good streets, one on each side of the river. The parish church of St. Botolph (1309), 245 by 98 ft., is one of the largest without cross aisles in England, and has a fine tower 300 ft. high, surmounted by a lantern, visible 40 m. out at sea. The church was partially restored in 1857, at the expense of the inhabitants of Boston in America. The clearing of the river of silt, and the closing of the adjacent fens, have greatly promoted the trade of Boston. Vessels of 300 tons can reach the heart of the town. The chief export is corn. Pop. of muni. bor. (1871), 14,526; of parl., which returns two members to parliament, 18,279. B. is a great market for cattle and sheep, and manufactures canvas, iron, brass, ropes, leather, bricks, whiting, and hats. In 1876, 542 vessels of 28,535 tons entered, and 617 of 40,586 tons cleared the port. Fox, the martyrologist, was born there.

BOSTON, capital of Massachusetts, United States, is situated in lat. 42° 21′ n., and long. 71° 4′ w. It stands at the w. end of Massachusetts bay, on an inlet, which, whether for defense or trade, forms one of the best havens in the world. This inlet, known as Boston harbor, the primary source of the city's growth and prosperity, has a seaward barrier of two headlands, the interval of 4 m. being so subdivided by an insular breastwork as to leave only three practicable entrances, the main one barely wide enough for two vessels to pass one another; while the inclosed space of about 75 sq.m. —at least half of it affording depth for the largest ships—greatly augments, with its islands and its peninsulas, both its military and commercial capabilities. On an oblong peninsula, of about 700 acres, running to the n.e., B. was founded in 1630, its original owner, John Blackstone, selling out his right and title, five years thereafter, for £30. With so well chosen a site, and, doubtless, also through the industry and enterprise of its Puritan occupiers, the new town increased so steadily in wealth and population, that in less than a century and a half it became the foremost champion of colonial independence. Since then it has overleaped its natural limits, swarming off, as it were, into an island towards the n.e., and into the mainland on the s.e., and consists of Old, East, and South Boston; Roxbury, annexed in 1868; Dorchester, annexed in 1870; and Charlestown, Brighton, and West Roxbury, annexed in 1873; which are connected together by bridges. An immense dam, called the Western avenue, connects the whole with the inner side of the harbor. All the divisions of the city are of an uneven surface. Undulation, in fact, is a characteristic of the entire neighborhood—continent, islands, and peninsulas, alike. From this irregularity, so different from the straight and formal lines of street in American cities, and also from being built of a very neat kind of brick, B. has much the appearance of a substantial English provincial town; the resemblance being, perhaps, heightened by the dress, manners, and feelings of the inhabitants, who are essentially of the old British type, as befits the descendants of the "Pilgrim Fathers." On a peninsula to the n. of East B., rises Bunker's hill, so famous in the war of independence; while the Dorchester heights, only less famous, occupy the center of South B.; and, lastly, the peninsula of Old B. seems to have originally taken the name of Tremont, from its three mounts or hillocks. Between 1840 and 1850 the population had swelled from 93,383 to 136,881; (1860) 200,000; (1870) 250,526; (1875) 341,919. Among the public buildings, the principal are the state house, city hall,

Faneuil hall, Faneuil hall market, Massachusetts hospital, post-office, custom-house, county jail, houses of industry and correction, two theatres, an athenæum, an odeon, a library, a music-hall—said to be one of the finest concert rooms in the world—and 200 churches. Among other objects worthy of note are the Common, a beautiful park of 50 acres, on the peninsula; the wharves and quays; and the bridges, sixteen in number, which unite together the different portions of Boston. The water-works demand more special mention. To say nothing of an earlier enterprise of the kind on a smaller scale, the waters of lake Cochituate, distant 20 m., have since 1848 been conveyed by a brick conduit into the grand reservoir of Brookline, at the further end of the Western avenue, and thence been carried into the subordinate reservoirs respectively of the different sections of the city. The annexation of Charlestown brought with it the waters of Mystic lake. B., as the center—social, political, and commercial—of the best educated and most intelligent state in the union, is pre-eminent throughout the republic in literature and science. Its trade, likewise, is marvelous: it is, in fact, more marvelous, in proportion to physical facilities, than even that of New York, for while the latter city, with the lakes on the one side and the ocean on the other, and with the Hudson as a link between them, drains regions of vast extent and singular fertility, B., to say nothing of rugged soil and ungenial climate, is cut off from the interior, such as it is, by the entire want of inland waters. But what New York has so largely inherited from nature, B. has in some measure created for itself. By eight great systems of railway it reaches, besides the coasts to the n. and s., the St. Lawrence and the lakes, the Hudson and the Mississippi; while, as the transatlantic terminus of the Cunard line, it virtually connects those channels of communication with Great Britain and its network of iron roads. In several departments of maritime traffic, such as the coasting intercourse and the trade with Russia, India, and China, B. is understood to possess far more than its share; and as the port of the manufacturing districts of the union, it may be said to monopolize the carrying alike of raw material and of finished goods. The chief exports are beef, pork, lard, fish, ice, woolens, cottons, paper, boots and shoes, cordage, hardware, and furniture; while the imports, wafted from all corners of the world, comprise nearly every article that has a name in commerce. The total number of vessels that entered the port in the year ending June 30, 1874, was 2717, of 730,769 tons, and the total number that cleared was 2552, of 659,102 tons. The total value of the imports in the same year was $52,212,405; and of the exports, $28,335,627. In 1877, the municipal debt was $26,159,777; the valuation of the city for taxation purposes was $630,427,200. The banks of the city possess an aggregate capital of $48,600,000; and there are issued 150 periodicals, nine of which are dailies. The charitable institutions, schools, and public libraries of B. are in harmony with the city's importance in other respects. The B. public library, with about 200,000 volumes, is the largest in the United States, after that of congress. In 1822, B., previously ruled like an ordinary township by selectmen, adopted a municipal organization, with a mayor, aldermen, and councilors.

BOSTON (*ante*), the capital of the commonwealth of Massachusetts and of the county of Suffolk, the largest city in New England, and, of American cities, second only to New York in the extent of its commerce, is situated on Massachusetts bay, at the mouth of the Charles river, in lat. 42° 21′ 28″ n., long. 71° 3′ 52″ w. from Greenwich.

The spot was first visited by Europeans in 1621, when a party of pilgrims from Plymouth, on an exploring expedition, entered the harbor and regretted that they had not made their own settlement where the city now stands. At about 1623, William Blaxton or Blackstone, an Episcopal clergyman, established himself on the w. slope of Beacon hill, not far from where Louisburg square is now situated. In 1627, certain men of fortune and religious zeal, merchants and "country gentlemen," in Lincolnshire, England, began to consult regarding planting a colony in New England, to spread the Gospel and advance the glory of God. On Mar. 4, 1629, Charles I. signed a charter constituting a body politic by the name of "The governor and company of the Massachusetts bay in New England." Charles II. at a later date stated that "the principle and foundation of the charter of Massachusetts was the freedom of liberty of conscience." On Aug. 26, in the same year, 12 men of large fortune and extensive cultivation in Cambridge, England, entered into an agreement to emigrate to the new country, provided the place of holding the courts should be removed from London to Massachusetts before the end of the following September. Among the men who joined in this agreement were John Winthrop and Richard Saltonstall. The government was transferred with the patent in Aug., and the commercial corporation became the germ of the present commonwealth. In the spring of 1630, the emigrating party sailed from Southampton in the ship *Arbella*, and entered the harbor of Boston June 17. Winthrop first settled at Charlestown, but subsequently removed to Boston, which received its name Sept. 17 (N. S.). The name was taken from Boston in Lincolnshire (which is a corruption of Botolph's Town), from its patron saint, whose church was founded in the 7th century.

Originally but a small peninsula connected with the mainland by a narrow isthmus called the "Neck;" the city now embraces nearly 23,000 acres, 800 of which were formed by filling in adjacent low lands. The territory has been increased also by the annexation of South Boston (a portion of Dorchester), in 1804; of the island of East Boston, in

1832; of Washington village, in 1856; of Roxbury (Boston Highlands), in 1867; of the remainder of Dorchester, in 1869; and of Charlestown, Brighton and West Roxbury, in 1873. The city contains 350 m. of streets, which have cost, since the incorporation of the city, in 1822, more than $31,000,000. In the older portions many streets are narrow and crooked; but after the fire of 1872, advantage was taken of this feature to make architectural effects in the new buildings, which are very pleasing, and would have been impossible had the streets been more regularly laid out. After the revolution the names of streets which were reminders of royalty were, in many cases, changed for more republican appellations, though many continue reminders of the old country, both in their names and in their appearance. The city is connected with its suburbs by many bridges, which are noted rather for their convenience than for their elegance, though that leading to South Boston is more pretentious than the others. The Mill-dam, begun in 1818 and completed in 1821, at a cost of $700,000, is a continuation of Beacon street, and originally inclosed 600 acres of "flats" which were overflowed by the tide. These, having been filled in, constitute the "Back Bay lands," and the district contains some of the most elegant dwellings and churches of the city. In the sleighing season the Mill-dam was formerly the scene of much hilarity and fast driving, but the advance of population has driven the horsemen to the Brighton road, a little further from the center of the town in the same direction. The suburban region lying about Boston is remarkable for the beauty of its varied scenery, as well as for the elegance and taste displayed in the private dwellings with which it is adorned.

Boston has many small parks, and an extensive series of connecting parks has been designed and is in process of formation, but at present the Common and the Public garden, in the heart of the city, are its chief pleasure grounds. The two comprise 70 acres, laid out with care, adorned with lofty elms and sheets of water, and with monuments. The city has, in public places, statues of Charles Sumner, Josiah Quincy, gov. Winthrop, Benjamin Franklin, Edward Everett, Horace Mann, Alexander Hamilton, Daniel Webster, Columbus, Washington, gov. Andrew, and Samuel Adams. Besides these, there is in Park square a group representing the emancipation of slaves, and on the Common another to the memory of the national soldiers who died in the war of the rebellion.

The harbor of Boston is a handsome sheet of water covering 75 sq. miles. It includes many islands, and is well fortified by forts Independence (until 1798 castle William) and Winthrop, opposite each other at the entrance of the main channel, and fort Warren, on George's island, lower down the harbor, opposite the end of Nantasket or Hull. Three light-houses mark the entrance to the harbor. Boston light is situated nearly two m. e. of fort Warren, and shows a revolving light 92 ft. above the level of the sea. The Spit, or Bug light, exhibits a fixed red light, about 35 ft. above the level of the sea. It stands upon iron pillars fixed in the rock, and can be seen at a distance of about seven miles. Long Island light, named from the island on which it stands, is a tower 22 ft. above the ground, but 80 ft. above the sea. A strong battery is now in process of erection on Long Island.

The executive power of Boston is vested in the mayor and 12 aldermen; and the legislative functions are performed by the mayor, aldermen, and 72 councilmen, all of whom are elected annually on the Tuesday after the second Monday in Dec. A fire commission, composed of three members, controls the fire department, which is admirably managed. Three commissioners also control the police department. The system of telegraphic fire-alarms was first introduced into Boston in 1851. The streets are kept clean, and the house offal is removed under the care of the superintendent of health. The house of reformation, the house of industry, and the alms-houses are situated on Deer and Rainsford islands, in the harbor, and are managed by the directors for public institutions. The house of correction and the lunatic asylum, under the control of the same body, are at South Boston. The city was supplied with water as early as 1795 from Jamaica pond, but the elevation was not sufficient to bring the supply to the higher portions of the city. In 1848, the Cochituate water-works were completed, and in 1872 the legislature passed an act permitting the city to take water also from Sudbury river. The latter works are now completed. Charlestown district is supplied from the Mystic water-works, which take water from Mystic lake in Medford.

Boston has many public buildings worthy of notice. Among those that are remarkable for architectural beauty or grandeur are the United States postoffice, on Postoffice square, Trinity church, the museum of fine arts, the hotel Vendôme, the cathedral of the Holy Cross, the state house, the English high and Latin school on Warren avenue, and the new "Old South church." The English high and Latin school was begun in 1877, and the portion to be used for school purposes is just completed, at a cost of more than $400,000. The remainder, which is to be used by the officers of the school-board, is to be added at a future time. The entire edifice will be one of the largest for educational purposes in America, or in the world.

Among the buildings remarkable rather for their historical interest than for architectural beauty is Christ church, on Salem street, the oldest church in the city, and the one from the steeple of which, in the revolutionary war, Paul Revere's signal was hung out by capt. John Pulling, merchant, of Boston. The Rev. Mather Byles, jr., was rector of this church during the revolution, and left town on account of his sympathy with the

royal cause. The old South church, built in 1730, is one of the most noted in the country. It was abandoned as a church in 1876, and since that time efforts have been made to purchase it as a monument commemorating the times that tried men's souls. In this building Joseph Warren delivered his memorable oration on the anniversary of the "Boston massacre," Mar. 5th, 1776. Here the patriots met to discuss the tax on tea. In 1775, the building was "desecrated" by British soldiers, who tore out its galleries, filled it with earth and used it as a place for cavalry drill. From 1712 to 1872, the annual "election sermon" was delivered in the old South church. It is now used as a historical museum. The most famous of the relics of the olden time is Faneuil hall, well known as the "cradle of liberty," from the fact that during the period preceding the revolution, it was used for public gatherings at which the patriotic spirit of the colonists was stirred by the eloquence of the popular favorites.

The original edifice was built as a market, and presented to the town by Mr. Peter Faneuil, in 1742. It was destroyed by fire in 1761 and rebuilt the following year. Before the adoption of the city charter in 1822, all town-meetings were held in Faneuil hall. The hall is 76 ft. square, and 28 ft. high, and possesses remarkable acoustic properties. Valuable paintings adorn its walls. A market is under the hall.

The "old state-house" stands at the head of State street. The town-house was built on the spot in 1763. The "Boston massacre" occurred in the street before it, and there the stamped clearances were burned by the mob, during the excitement caused by the stamp act. Independence was born in the building, according to gov. Adams, and from the balcony the declaration of independence was read. It was here that those town-meetings were held at which Otis uttered his prophetic and patriotic words, counseling peace, but foretelling probable war, and urging resistance to tyranny, "even unto blood," if necessary.

From the first, Boston has been noted for its commerce. Eight lines of railways connect it with the interior, and ships and steamers sail from the capacious harbor to all parts of the world. Large quantities of fish, ice, and manufactured products are exported. The ice trade was begun here by Frederic Tudor, who, in 1806, made the first shipment to Martinique. It is said that but for the trade in ice, the business between Calcutta and Boston would never have reached its present proportions. Boston is now the second city in the union for foreign commerce; it is a center of the boot and shoe trade, the leather trade, and of the trade in foreign and domestic dry goods. The manufactures of the city are many and varied, including—besides ship-building, sugar refining, and leather dressing—clothing, jewelry, chemicals, brass and iron castings, and books. The business of the city is promoted by sixty-one national banks—more than any other city in the union has—with a capital of more than fifty-three million dollars. Thirty of these have cash capitals of one million or more each. The surplus funds of the inhabitants are, in part at least, deposited in sixteen savings banks, the first of which, the Provident institution, was founded in 1816, and has larger deposits than almost any other institution of the kind in the country. These banks are strictly guarded by laws which restrict the amount that can be deposited by any one person and otherwise protect their solvency.

From the earliest days Boston has been noted for the care with which it provided for the religious wants of the people, for their education and for the distribution of literature. The first "meeting house" was erected near the head of State street, 1632. John Cotton was one of its pastors. The city contains now nearly 200 churches. Of these the larger numbers belong to the Congregationalists (evangelical), the Unitarians, Baptists, Methodists, Roman Catholics, and Episcopalians, in the order mentioned. Free schools, open to all, were established in the United States first in Boston 250 years ago, and the excellence of the system of public instruction there has been so great that many other cities have taken its schools for patterns. The university at Cambridge properly belongs to the Boston school system, for it was founded by the men who settled Boston and was intended for the education of the youth of the city and surrounding country. Indeed, "Newe Town," as Cambridge was first called, was intended for the capital of the commonwealth. It was John Winthrop who directed attention to the superior advantages of the neighboring promontory, after fortifications had been commenced at the former place. Harvard college was founded in 1636, and for two generations was the only college in New England. The public Latin school in Boston was founded in 1635, the institute of technology in 1861, Boston college in 1863, Boston university in 1869. There are more than 200 public schools in the city. Nine of them are high schools, 49 are grammar schools, and one is a normal school. The salaries of the teachers amount to about one and a quarter million dollars a year. Private schools abound, and their reputation is high. Chauncy Hall school, established 1828, is one of the most prominent of these. It occupies a building on Boylston street, near the institute of technology. In regard to the number and extent of its public libraries, Boston stands at the head of American cities. The chief libraries are the Public, with 360,000 volumes, distributing 1,250,000 volumes a year; the Athenæum, 115,000 volumes, circulating 50,000 volumes a year; the Historical society's library, containing 68,000 books and pamphlets, many of them being among the rarest of publications; the state library, with 40,000 volumes; the Social law library, with 15,000 law books; the library of the Historic-genealogical society, 74,000 books and pamphlets; the General theological library, with 13,000 volumes; the library

of the Natural history society, containing 17,000 books and pamphlets; the Congregational library, with more than 100,000 books and pamphlets, illustrating the history of the religious denomination to which many of the early settlers of New England belonged. Boston has musical societies, art associations and social clubs. Among the clubs the most prominent are the Somerset, the Union, St. Botolph, the Papyrus, the Saturday, and the Woman's club. Several of these have well-appointed buildings. The clergy have meetings at stated times for the discussion of topics related to their calling. Boston is well supplied with hospitals and societies for the aid of the indigent and suffering. In 1876, a plan for the registration of the worthy poor was set in operation, for the purpose of discriminating between the worthy and unworthy and for greater economy in the distribution of relief.

The city is well supplied with theaters, and is said to be one of the best in the country for the appreciation of good actors and singers. Also, there are many halls in which lectures are given from time to time on almost every topic that interests the human mind.

The 250th anniversary of the settlement of Boston was celebrated Sept 17, 1880, with great enthusiasm. For 193 years Boston was a town, the city charter having been accepted as late as 1822, after the subject of the change had been discussed for 170 years. The population for the first two centuries did not rapidly increase, being about 7000 in 1700; 15,520, in 1764; 18,038, in 1790; 61,392, in 1830; 250,526, in 1870; 341,919, in 1875; and 363,968, in 1880. Much of the late gain has arisen, of course, from the annexation of adjoining territory. In early days—at least as early as 1634—the town was governed by "selectmen," but when such officers had first been chosen is not now known. The first grand jury of the country met in Boston, Sept. 1, 1635. The church in Boston was vexed in early times by Roger Williams, Mrs. Anne Hutchinson, the Quakers, by women possessed by witches, and by Episcopalians; and rigid laws were enacted to bring the offenders to give up their peculiar views or leave the town. Boston sympathized with Goffe and Whalley, the regicides, who appeared in the town in 1666; in 1688, the inhabitants rose against the government and overthrew it: the city bore its share of the burden of the "old French war;" and its inhabitants entered with patriotic zeal into the struggle for independence. In the late war Boston was prompt to offer soldiers and money for the purposes of the general government, and her officers and men made a record of which they and their fellow-citizens have always been proud.

BOSTON, PUBLIC LATIN SCHOOL IN, founded 1635, is designed to give a thorough general culture to boys who intend to pursue the higher branches of learning, or to prepare for professional life. It is organized in six classes, and the full course of study covers the period of six years. Graduates of grammar schools, to whom diplomas have been awarded, are admitted without examination to whatever class their qualifications may entitle them to enter. Other applicants have to pass an examination equivalent to that required for admission to the third class of the grammar school. The standard of graduation is that of admission to colleges of the highest grade. The early records of the school are imperfect, but the catalogue printed in 1847 contains about 5000 names, and among them are many of those eminent in the history of the country. Adding those who have attended the school since that date, we have a total of about 7500. The whole number of graduates is reckoned at about 3400. It is believed that at least 3000 of its pupils are now living. It has now 13 teachers, and 400 pupils, and a library of about 3000 volumes, mostly classical. Prizes are offered annually for superior proficiency in various studies, and for exemplary conduct. The school was once on School street, on the site of the Franklin statue, in the rear of King's chapel; afterwards on the opposite side of the same street at the corner of the alley, on the site of the Parker House; at present on Bedford street. It will soon be removed to a new and elegant building on Warren avenue. The master of the school at present is Moses Merrill. Among the former masters were Philemon Pormot (first master), Ezekiel Cheever, Benjamin A. Gould, Charles K. Dillaway, Epes S. Dixwell, and Francis Gardner.

BOSTON UNIVERSITY, Boston, Mass., incorporated in 1869, was founded by Isaac Rich, Lee Claflin, and Jacob Sleeper. Its president since its foundation is William F. Warren, S.T.D., LL.D. The chief organs of its administration are: 1, the university corporation; 2, the university council; 3, the university senate; 4, the university convocation; 5, the faculties of the colleges; and 6, the faculties of the schools. The first consists of the president of the university and five classes of trustees, each holding office for five years; the second of the president and registrar of the university and the deans of all the faculties; the third includes all members of the council and all regular professors in the different faculties; the fourth consists, under certain statutory limitations, of all who have been admitted to degrees in the university. Departments, so organized as to presuppose on the part of the students a collegiate education or its equivalent, are called schools. Some of these, organized and administered in the interests of persons preparing for professional life, are called professional schools. Crowning all is the school of all sciences, a purely post-graduate department for candidates for the higher degrees. There are the following departments: college of liberal arts, established 1873; college of music, 1872; college of agriculture (Mass. agricultural college, at Amherst), 1875; school of theology, 1871; school of laws, 1872; school of medicine, 1873; school of all sciences, 1874. The college of liberal arts has fixed a standard for admission to classical degrees

as high as that of any other university. Post-graduate students in the university may fit themselves for professorships of Greek, Latin, modern languages, philosophy, history, etc. By arrangements with the authorities of the national university at Athens, and those of the royal university of Rome, members of the school of all sciences, duly recommended, may pursue, without expense for instruction and for any number of years, select or regular courses of study in any department of those universities, enjoying all the rights and privileges of university citizenship, and, upon returning and passing satisfactory examinations upon the work accomplished, can receive a degree as if they had remained in Boston. The greater part of the endowment of the institution was bequeathed by the late Isaac Rich, a member of the Methodist Episcopal church. As it is not to pass into the hands of the university corporation till 1882, its amount cannot yet be stated. The average number of officers of instruction and government during the past four years has been 100; the average number of students over 600. The institution maintains graded courses of instruction in theology, law, and medicine, three years in duration. In medicine its course extends through four years, while the degree of bachelor of medicine has been restored. The university was organized and has been constantly administered without any discrimination in government or teaching on account of sex. Every degree, privilege, and emolument is as open to women as to men. This institution does not gather its students into dormitories or exercise any supervision over them except in the recitation rooms.

BOSTON, a game at cards, played by four persons with two packs, one being dealt and the other cut to determine the trump. Five cards to each are dealt twice around and then three to each. If the first player can take five tricks he says "I go Boston," when the others may overbid by saying "I go 6," 7, 8, and so on. Should any player fail to make as many tricks as he said he could take, he pays such forfeit as may have been regulated before playing.

BOSTON, THOMAS, a Scottish divine, once extensively popular, was b. of poor parents at Dunse, Berwickshire, Mar. 7, 1676. As early as his 12th year he was concerned about the state of his soul, and while only a boy at the grammar school, he formed a society of three for religious conference and social prayer. After a hard struggle, he succeeded in entering Edinburgh university in 1691. He received license as a preacher in 1697, and was greatly appreciated by the serious portion of the community; but his uncompromising character prevented him from receiving a clerical charge for two years. He was then ordained minister of Simprin, and in 1707 was translated to Ettrick, where he died on the 20th May, 1732. Of his voluminous works, the best known, but not the most agreeable, is the *Fourfold State*, published in 1720. It discourses of man's paradisaical integrity, his ruin by the fall, his begun regeneration on earth, and consummate bliss or woe hereafter. An excellent little treatise of B.'s is entitled *The Crook in the Lot*. As a pastor, B. was eminently laborious, and deservedly popular. In the ecclesiastical courts he distinguished himself by his zeal in defense of the church's independence, and in the controversy regarding the *Marrow of Modern Divinity* (which was objected to as being too free in its offers of salvation), he was one of the ten ministers who declared their approval of that work. See MARROW CONTROVERSY. As a theologian, B. is perhaps the most "representative man" in the whole list of Scottish divines. His language, sentiments, and peculiar modes of expressing the peculiarities of Calvinistic psychology, have colored the style of Scottish preaching more than any other writer of the same school has done. Although often displaying what we should now call narrowness and ignorance, B. exhibits also flashes of insight and beauty, quaint felicities of diction—as, for instance, when, in *The Crook in the Lot*, he warns the profligate against the possibility of a "leap out of Delilah's lap into Abraham's bosom"—and an occasional shrewdness of thought, which are even yet worth studying. B.'s autobiography used to be a great favorite with the Scottish peasantry.

BOSTRA. See BOZRAH.

BOSWELL, JAMES, Esq., of Auchinleck, in Ayrshire, celebrated as the friend and biographer of Dr. Samuel Johnson, was b. Oct. 29, 1740, at Edinburgh, where his father was one of the judges of the court of session, and as such was styled lord Auchinleck. He was intended by his father for the profession of an advocate, and studied first at Glasgow, and afterwards at the then famous university of Utrecht, to which he went in 1763. When in London in that year he made the acquaintance of Johnson, an event of decisive importance for his whole subsequent life. The acquaintance was earnestly sought by himself, and originated in his strong literary tastes and his ardent admiration of Johnson's writings. He spent one winter at Utrecht, and then proceeded on a tour through Germany, Switzerland, and Italy, and visited Corsica with a letter of introduction from Rousseau to Paoli, with whom he contracted a warm and lasting friendship. He enthusiastically adopted the cause of Corsican independence; and after his return to Scotland, published an *Account of Corsica, with Memoirs of General Pasquale Di Paoli* (Glasg. 1768; 3d ed., Lond. 1769), which was speedily translated into several languages. B. became a member of the faculty of advocates in 1766, but never devoted himself with earnestness to the business of law. In 1773, he was admitted into the literary club instituted by Johnson, and of which Burke, Goldsmith, Reynolds, and Garrick were members. From this time he made it his principal business to note down the say-

ings and doings of Johnson, with whom he associated on most intimate terms, and whom he accompanied on his tour in Scotland and the Hebrides in 1773. Boswell was married in 1769 to a lady named Montgomery, by whom he had several children. Led by his taste for London society, he removed thither at a mature period of life, and entered at the English bar, but without attaining to any success in the profession. After Johnson's death in 1784, he employed himself in arranging the materials which he had collected, and preparing his long-contemplated biography. His *Journal of a Tour to the Hebrides* appeared in 1785, his *Life of Samuel Johnson*, in 2 vols., in 1791. Both have gone through many editions. B. has been emphatically styled by Macaulay "the first of biographers." His work is indeed full of details but they are such as exhibit character, and are arranged in the most interesting manner. He neither conceals his own faults, nor those of Johnson, but presents a picture of which the truthfulness is too evident to be questioned; and Johnson is perhaps already better known by the pages of B. than by any of his own writings. B. died in London, June 19, 1795. Besides the works already mentioned, he was the author of one or two minor productions of temporary interest. In Dec., 1856, there was published a posthumous volume of *Letters of James Boswell, addressed to the Rev. W. J. Temple, from the Original MSS.*, in which the gay, *insouciant* character of the man very strongly appears. His eldest son, Sir ALEXANDER BOSWELL, baronet, of Auchinleck, born 1775, was the author of a number of Scottish songs, full of humor, which he collected into a volume, entitled, *Songs, chiefly in the Scottish Dialect* (Edin. 1803), and some of which attained considerable popularity. He also wrote *Edinburgh, or the Ancient Royalty*, a picture of Scottish manners in the dialogue form, and edited many of the older productions of Scottish literature. A duel with Mr. Stuart of Dunearn, occasioned by personal allusions in a publication connected with a parliamentary election, resulted in his death on Mar. 26, 1822.

BOSWELLIA, a genus of trees of the natural order *amyridaceæ* (q.v.), having flowers with a small five-toothed calyx, five petals, and a crenulated grandular disk; a triangular capsule with three valves, three cells, and one seed in each cell; the seeds winged on one side; their cotyledons intricately folded, and cut into many segments. Two or three species only are known, of which the most interesting is *B. serrata* (or *B. thurifera*), the tree which yields olibanum (q.v.), now very generally believed to have been the frankincense (q.v.) of the ancients. It is a large timber-tree, with pinnate leaves, which have about ten pair of hairy serrated oblong leaflets, and an odd one, each leaflet about 1 to 1½ in. in length. The flowers are small and numerous, in axillary racemes, and of a pale pink color. When the bark is wounded, the olibanum flows out, of a delightful fragrance, and hardens by exposure to the atmosphere. The tree is found in the mountainous parts of Coromandel, and is supposed to be also a native of other parts of India, and of Persia, Arabia, and perhaps Abyssinia. *B. glabra*, a very similar species, a native of India, also yields a resin, comparatively coarse, which is sometimes used for incense, and is boiled with oil as a substitute for pitch.

BOSWORTH, or MARKET BOSWORTH, a market t. in Leicestershire, on an iminence in a very fertile district, 12 m. w. of Leicester. Pop. in 1871, 13,746, many of whom are employed in knitting worsted stockings. On a moor in the vicinity was fought, 1485, the battle in which Richard III. was slain, and which terminated the wars of the roses. On an elevation, called Crownhill, lord Stanley placed the crown on the head of the earl of Richmond, Henry VII. Here Simpson the mathematician was born; Dr. Johnson was an usher in the free grammar school, in which Salt the Abyssinian traveler, and Richard Dawes the Greek critic, were educated.

BOSWORTH, JOSEPH. D.D., a distinguished philologist, was a native of Derbyshire, where he was b. in 1789. He graduated first at Aberdeen, and afterwards at Leyden; he also took the degrees of B.D. and D.D. at Cambridge and Oxford. He obtained a curacy in the English church in 1815, and two years afterwards the vicarage of Horwood Parva, Buckinghamshire. He now devoted such time as an active discharge of his parochial duties left at his disposal to literature, and especially to researches in Anglo-Saxon and its cognate dialects. The result of his labors appeared in 1823 in a work, entitled *Elements of Anglo-Saxon Grammar*. Fifteen years afterwards, he published the work by which his name is best known, *A Dictionary of the Anglo-Saxon Language* (Lond. 1838), which is considered alike remarkable for its ripe scholarship, enlarged views, copiousness, and accuracy. An abridged edition was afterwards issued by the author. B. resided in Holland eleven years, from 1829 to 1840, as British chaplain. He returned to England in 1840, and was presented to the vicarage of Waithe, in Lincolnshire. In 1858, he became rector of Water Stratford in Buckinghamshire, and also professor of Anglo-Saxon at the university of Oxford. In 1865, he published the gospels in Gothic of 360 A.D., and the Anglo-Saxon of 995 A.D., in parallel columns with Wycliffe's version of the year 1389, and Tyndale's of 1526. He was author of various other works of a philological character. His death took place on May 27, 1876.

BÓSZÖRMÉNY, the chief of the six towns of the free district of Hadjuk, in the e. of Hungary, about 10 m. n.n.w. of Debreczin. It carries on an active trade in rye, tobacco, water-melons, soda, and saltpeter. The population in 1869 amounted to 19,208.

BOT, BOT-FLY, and GAD-FLY, names common to many insects of the family *œstridæ* (q.v.) or *œstracidæ*, the genus *œstrus* of Linnæus. The name bot is sometimes restricted

to the larvæ, which appears to have been its original use, the other names being given to the perfect insects; the name gad-fly often to insects of the genus *tabanus* (q.v.), to which some try to restrict it. The insects of this family are now supposed not to be those which were called *æstrus* by the ancients, although, like them, extremely troublesome to cattle. They are dipterous (two-winged) (q.v.) insects, nearly allied to the *muscides* (house-fly, flesh-fly, blow-fly, etc.), with small 3-jointed antennæ, and mouth destitute of a proboscis.—The horse-bot, or gad-fly of the horse (*gasterophilus*, or *gastrus*, or *æstrus equi*), sometimes also called the *breeze* and *horse-bee*, is much less common in Britain than in some parts of the continent of Europe, and occurs chiefly in elevated healthy districts. It is not quite half an inch in length, woolly, with yellowish gray head, rusty thorax, abdomen, and the wings whitish, with brownish-gray spots. The abdomen of the female terminates in a blackish horny tube. In the latter part of summer, the female hovers about horses, and deposits her eggs on their hairs, where they remain attached by a glutinous substance until they, or the larvæ just emerging from them, are licked off by the tongue of the horse, their destined place being its stomach. It is believed that the fly deposits her eggs only on those parts which are accessible to the horse's tongue, seeming to prefer the back of the knee-joint, where they may sometimes be found in hundreds. The larva is yellowish, without feet, short, thick, soft, composed of rings which have a double row of short teeth surrounding them; it is somewhat acuminated at one end—the head; and the mouth is furnished with two hooks, one on each side, for taking hold of the inner coat of the horse's stomach, to which the B. attaches itself, and from which it derives its subsistence, hanging in clusters sometimes of three or four, sometimes of more than one hundred. Here it spends the winter, and in the following summer, when it is about an inch long, it disengages itself, and being carried through the horse's intestines, burrows in the ground; and changes into an oval black pupa with spiny rings, from which, in a few weeks, the perfect insect comes forth. Multitudes, of course, become the prey of birds, before they can accomplish their burrowing.—It has been disputed whether or not bots are very injurious to horses; and some have even maintained that, when not excessively numerous, their presence is rather beneficial, an opinion which is certainly not recommended by its apparent probability, whilst it seems to be universally admitted, that in great numbers they are hurtful.—The red-tailed horse-bot (*G.* or *Œ. hæmorrhoidalis*), also a British species, deposits its eggs upon the lips of the horse, distressing it very much by the annoyance which it gives in so doing. The larvæ attach themselves chiefly to the surface of the intestine, about the anus of the horse, and sometimes cause an annoying irritation. Linseed-oil is used for their removal.—The Ox-bot, or ox gad-fly (*æstrus* or *hypoderma bovis*) is more troublesome than any species of horse-bot. It is a beautiful insect, not quite half an inch long, and thicker in proportion than the horse-bots; it has brown unspotted wings; the face whitish, the crown of the head brown, the thorax black, the abdomen whitish, with a broad black band around the middle, and yellow hairs at the extremity, where also the female has an ovipositor—a remarkable organ, formed of a horny substance, and consisting of four tubes retractile within one another, like the pieces of a telescope; and the last of them terminating in five points, three of which are longer than the others, and hooked. By means of this organ, a small round hole is pierced in the hide of an ox's back, in which an egg is deposited. The fly is very quick in depositing her egg, not remaining upon the back of the animal more than a few seconds. Cattle exhibit great alarm and excitement at the presence of the gad-fly, and rush wildly about, with head stretched forward, and tail stuck out, to escape from their tormentor. The further injury done by this insect is not, however, usually great; the larva—a little pearl-white mag ot (*warble* or *wormal*)—feeding upon the juices beneath the skin, causes a swelling, called a *warble*, forming a sort of sac, within which it lives and grows, amidst a kind of purulent matter suited to its appetite; and from which it finally emerges, leaving a small sore, and like the horse-bot, undergoes its further transformations in the ground. By pressure on the warbles, bots may be destroyed, and when they are numerous, assiduous oiling of the back of the ox is resorted to for the same purpose.—The Sheep-bot (*œphalemyia* or *æstrus ovis*) is a much more serious pest than any other British species, and is not unfrequently very destructive to flocks. The insect is smaller than either the ox-bot or horse-bot; it is of grayish color, with a large head and yellow face, and is most abundant in damp situations and woody districts. It is to be seen chiefly in the months of June and July. Sheep exhibit great alarm when it approaches them, and seem to seek, by keeping their noses close to the ground, and by incessant motion of their feet, to keep it from entering their nostrils. It is in the nostrils of the sheep that this fly deposits its eggs, and the larvæ, when hatched, make their way into the maxillary and frontal sinuses, feeding upon the juices there, until they are ready to change into the pupa state, in April or May of the following year, when they find their way again through the nostrils to the ground. They seem to cause great irritation in their progress up the nostrils of the sheep, and the poor animals run hither and thither, snorting and in great excitement. "The common saying, that a whimsical person is *maggoty*, or has got *maggots in his head*, perhaps arose from the freaks the sheep have been observed to exhibit when infested by their bots." The bots cause considerable irritation in the cavities, where they usually fix themselves, and sometimes get into the brain, and cause death.—These larvæ move with considerable

quickness, holding on by the hooks with which their mouth is furnished, and contracting and elongating the body. It is said that flocks fed where broom is in flower are never infested with them; and when many cases arise in a flock, it is found particularly advantageous to remove it to a dry soil.—Goats, deer, and other quadrupeds are also liable to be assailed by different kinds of gad-fly. The eggs of one of the species which attacks the fallow-deer, are deposited in the nostrils, and the larvæ make their way in large numbers to a cavity near the pharynx. Reindeer are excessively tormented by these insects, one kind depositing its eggs in their nostrils, and another in their skin; and it is no infrequent thing for a large part of a flock to be destroyed by them. When feeding where bot-flies are numerous, they keep such watch against them, that they neglect to eat, become emaciated, and often actually perish in consequence.—Even human beings have sometimes been afflicted by insects of this family. Humboldt saw Indians in South America having the abdomen covered with tumors produced by their larvæ.

BOTAL'LI, LEONARDO, b. 1530, in Piedmont; physician to the queen of Charles IX. and to Catherine de Medici. He was the author of several medical works, but is best known by his blunder in describing the foramen ovale between the right and left auricles of the heart, still known as the "foramen of Botal." He found this open in a grown person—an exceptional case, since it is usually closed at or soon after birth, but he took the exceptional for the natural condition, and described it as an opening for passing arterial blood into the left auricle.

BOTANIC GARDEN, a garden devoted to the promotion of botany, and in which plants are collected and cultivated in order to scientific study. The various economical applications of botany, however, in agriculture, manufactures, medicine, etc., are almost always kept particularly in view; and one great object of a B.G. is to bring to a country useful foreign plants, to determine the question of their suitableness to its climate, and to introduce those which may be cultivated with advantage. B. gardens are now deemed indispensable to universities; they are reckoned among the public institutions of great cities, and even of nations, and are established in new colonies, not only for the sake of science, but as one of the means of promoting their prosperity. They are utterly unknown to the ancients, although some of the secondary objects in which they are found most useful engage the attention of both Greeks and Romans. The first approach to a B.G. appears to have been made about 1309 A.D., in the garden of Matthæus Sylvaticus, at Salerno; botanical science, however, being merely subservient to medicine. Of a similar character was the medical garden established at Venice, by the republic, in 1333. The example of Venice was followed by other Italian cities, and plants from different parts of the world began to be collected. At length, about contemporaneously with the revival of botanical science in modern times, the first true B.G. was formed in 1533 at Padua, by Musa Brassavola, for Gaspar de Gabrieli, a wealthy Tuscan noble; which was soon followed by those of Pisa, Florence, Bologna, and Rome. The first public B.G. was that of Pisa. A public B.G. was established at Padua in 1545, by a decree of the republic of Venice, at the request of the professors and students of medicine. The republic of Venice greatly encouraged the study of botany by sending persons to the Levant, to Egypt, and even to India, to procure plants for this garden.—The B.G. of Leyden was begun in 1577; it enjoyed in its infancy the care of Clusius, and was brought to great perfection by Boerhaave, who was professor of botany there.—The first public B.G. in Germany was established by the elector of Saxony at Leipsic in 1580, and was soon followed by others.—France had no B.G. till Louis XIII. established the *jardin des plantes* at Paris, which was begun in 1610, but not completed till 1634.—Nor was there any public B.G. in England till 1632, when that of Oxford was founded by the earl of Danby. Private B. gardens, however, had existed in England for the greater part of a century before.—The G.B. of Edinburgh, the first in Scotland, was founded about the year 1680, as a private B.G., by Dr., afterwards Sir Andrew, Balfour, a zealous naturalist, who had inherited a collection of plants formed by a pupil of his own, Patrick Murray, of Livingston, at his country-seat, and transferred them to Edinburgh; and the city of Edinburgh afterwards allotted to it a piece of ground, and allowed an annual sum for its support out of the revenues of the university.

The B.G. at Kew occupies a high place among British national institutions; it possesses one of the richest collection of plants in the world, and has been greatly improved under the care of sir William Jackson Hooker and his son, who succeeded him in 1865. The *Hortus Kewensis* of Mr. Aiton, to whom the garden owed much of its prosperity in the 18th c., illustrates the greatness which it had even then attained. One of its chief glories is now its immense palm-house, finished in 1848, which is 362 ft. in length, and the central part of it 100 ft. wide and 66 ft. high.—A palm-house has, in like manner, greatly added to the attractions and value of the B.G. of Edinburgh. It is 100 ft. long by 60 ft. wide, and 70½ ft. high. These houses permit something of the stateliness and magnificence of the palms of the tropics to be seen in Britain.

Of B. gardens on the continent of Europe, the *jardin des plantes* may be regarded as holding the first place, both with reference to the strictly scientific study of botany, and to the care bestowed upon the introduction and diffusion of useful or beautiful plants from all parts of the world. There exists in France what may be called a system of B.

gardens—one at least in every department—to which plants are sent from the *jardin des plantes*, and from which, as they continue to be multiplied by propagation, they soon find their way into the hands of nurserymen and private cultivators. The B.G. connected with the imperial palace at Schönbrunn, in Austria, and that of Berlin, are the greatest in Germany. The former, which was begun in 1753, by the emperor Francis I., was supplied with West India plants at enormous expense, the celebrated Jacquin being sent to procure them. The B.G. of New York is perhaps the most worthy of notice among the numerous bonanic gardens of America; and that of Calcutta deserves to be mentioned, as an important connecting-link between the B. gardens of Europe and the botany of India. It has enjoyed the care of a succession of eminent botanists, and has been very useful both in transmitting Indian plants to other parts of the world, and in introducing valuable productions of other countries into India.

In the laying out and arranging of B. gardens, different methods are adopted, mere convenience and beauty being in some cases primarily regarded, and these in other cases being sacrificed to the supposed interests of science in an attempted scientific arrangement. A perfect adherence to a botanical system is, for obvious reasons, impossible; but a scientific arrangement of the plants in natural groups, in so far as it can be conveniently accomplished, greatly increases the usefulness of a B.G., and facilitates the study of botany. Sometimes houses are devoted to particular orders of plants, as palms, heaths, or orchids; sometimes to plants of particular habits, as aquatic plants; and sometimes portions of the garden are advantageously devoted to the exhibition, at one view, of plants valuable for particular uses, as cereals or corn-plants, plants yielding fiber, etc.

BOTANIC GARDEN (*ante*) of Harvard university was founded in 1805, in March; William Dandridge Peck was chosen professor. He began to lay out the garden, but the next year went to Europe to examine similar institutions. There was a scarcity of money, and the garden languished for years. It was in charge (about 1822) of Thomas Nuttall, an English botanist, who, in 1833, suddenly deserted his post to make a tour across the continent and to the Sandwich islands. In 1842, Dr. Asa Gray was appointed Fisher professor of natural history, on the endowment given by Dr. Fisher of Beverly. In 1848, a study was built for a herbarium, and used for botanical instructions. In 1857 a new and larger conservatory was built. In 1864, the herbarium was erected, the gift of Nathaniel Thayer. After much exertion, the establishment was practically completed in 1871 by the fitting up of a lecture-room and laboratory, and an extension of the conservatory, thus connecting the herbarium on one side and the conservatory on the other into a continuous range, and affording the means of giving the whole botanical instruction throughout the year at the garden, in connection with the materials and collections which illustrated it. A fine botanic garden is connected with the department of agriculture at Washington, and there are others more or less important in various parts of the country.

At Buitenzorg, in the island of Java, near the foot of Mt. Salak, are botanic gardens which have been called the finest in the world. Here one can wander for hours through avenues of every kind of tropical palm. The orchids are a splendid collection, containing specimens of nearly every known kind of lælia, dendrobium, eria, bolbophyllum, cypripedium, and a host of others.

There are huge beds of ferns; plantations of gigantic yucca and pandanus, interspersed with dracænæ and eucharis; a forest of tree ferns, many of them upward of 30 ft. high; with bamboo avenues, and nearly every palm. Among them grow enormous creepers, one of which winds in circles about the ground, and then goes over a palm-tree and down again, upward of 300 ft. long; 70 yards alone are on the ground.

BOTANOMANCY, divination by means of plants. See DIVINATION.

BOTANY (Gr. *botane*, an herb), the science which treats of the vegetable kingdom (see PLANT). Everything that relates to plants is included in this science; there are, therefore, several great branches of it, in many respects very different from each other. Of these branches of the science, some, relating to plants in general, rather than to particular kinds or species, are sometimes included under the designation of *general B.* (sometimes called *phytonomy;* Gr. *phyton*, a plant, and *nomos*, a law); whilst those which relate to particular species, their distinctive characters, distribution, etc., are, in like manner, comprehended under the term *special botany*.—In the former of these departments, the first place must be assigned to *structural B.*, also called *organology*, or *organography*, which has for its subject the structure of plants, the textures of which they are composed, and their various organs. Subordinate to this are the study of the elementary tissues of plants, sometimes called *vegetable histology* (see HISTOLOGY), and that of the anatomy of plants, sometimes called *phytotomy* (Gr. *phyton*, a plant, and *tomē*, a cutting); both of which have recently been prosecuted with great assiduity. In both, the microscope is an indispensable instrument, and by means of it all the important discoveries of modern times have been made. Intimately connected with these is *morphology* (Gr. *morphos*, a form, and *logos*, a discourse), that branch of botanical science which relates to what has been called the *metamorphosis of organs*, or, in other words, the gradual transmutation of leaves by the processes of vegetable life into the various organs with which a plant is provided, and their consequent assumption of new forms and

adaptation to new uses. This branch of B., entirely of recent origin, has been described as being in the vegetable what comparative anatomy is in the animal kingdom, and has now become the exposition of an admitted great general law, almost equally important in reference to structural B. and to vegetable physiology. *Vegetable physiology* or *physiological B.* treats of the various kinds of organic activity which are displayed in the life of plants. It is based upon *structural B.*, an intimate acquaintance with which is indispensable to the study of it. The arguments or illustrations of natural theology, derived from B., are chiefly taken from structural B. and vegetable physiology considered together, the wisdom of the Creator appearing in his works equally in their structure and in the adaptation of all their organs to their respective wonderful functions. In connection with vegetable physiology, another branch of science claims attention—VEGETABLE CHEMISTRY, of which there are two parts—an examination of the products of the living processes in plants, which, with all its well-known difficulty, is still comparatively easy; and an inquiry into these processes themselves, with respect to the chemical changes effected in them—an investigation of the secrets of that chemistry of nature which so far excels all that has yet been accomplished in laboratories. This is, however, a branch of the science of chemistry rather than of B.; but it so far belongs to the latter, that although only subsidiary, it is useful and indispensable. Even mathematics and natural philosophy, however, have been called to the assistance of the philosophical botanist in his attempts to explain the phenomena of his own science.

Special B. has been rendered subservient to the study of general B., and errors in the former are also guarded against by dependence, to a certain extent, on the well-ascertained principles of the latter. A comprehensive view of the vegetable kingdom is indeed impossible without an inquiry into the number and peculiarities of the different species which it contains; but the attempt to classify and arrange these can only be successful when it is founded on a knowledge of general laws relating to all vegetable organisms. That the discoveries of a botanist may be made known, the description of species is necessary; and works devoted to this are sometimes called works of *descriptive B.* or of *phytography* (*phyton*, a plant, and *graphē* a writing). But in the description of plants, a multitude of terms must be employed, which almost exclusively belong to botanical science itself, whilst even those which are common to it with other departments of natural history, must be employed in senses modified by the peculiarities of the vegetable kingdom. Many of the terms used are such as belong to structural B. and vegetable physiology; but many also—for example, adjectives which designate the particular forms of leaves, etc.—become familiar only when an acquaintance with them is sought to advance descriptive B., and a knowledge of the different species of plants. Great precision is necessary in the use of these terms, and from the want of it, the descriptions of the ancients and of travelers unacquainted with B. often leave it impossible to determine the particular species intended. This gives rise to what is sometimes called in botanical works *terminology*—an explanation of botanical terms, which, however, has no right to be regarded as a separate branch of science, or worthy of a distinct name; and the name which it has received is barbarous. When structural B. was little heeded, and little more was commonly supposed necessary for a botanist than a knowledge of species and the ability to distinguish them, "terminology" was often separately taught, and the student was required to commit long tables of terms and their meanings to memory—a difficulty placed in his way at the outset which was both formidable and repulsive, like that which the student of the Chinese language must expect to encounter in its alphabet.

The necessity of classification and systematic arrangement in B. will be very obvious, if the multitude of different kinds of plants is considered, fully 120,000 species being already known and described, whilst great regions of the earth are still unexplored. The systematic arrangement of plants is sometimes called *systematic B.*, sometimes *taxological B.* (Gr. *taxis*, order, and *logos*, a discourse), sometimes, less properly, *taxology* or *taxonomy*. The history and progress of the science have been marked by the different systems which have been proposed, and have prevailed at different times. These have, however, been of two very distinct kinds, founded upon very different principles, and particularly adapted to very different objects, and are respectively designated *artificial* and *natural* or *physiological* systems. Artificial systems are based upon some single class of characters, in the external parts of plants, without reference to the importance of these characters in what concerns the life of a plant, or the purpose for which it exists, and are chiefly adapted to the convenience of the student desirous of readily distinguishing species among the multitudes with which he has to deal. A work of descriptive B., arranged according to an artificial system, has been aptly likened to a dictionary in which the words are alphabetically arranged.

An artificial system cannot, however, serve the highest purposes of the science. But in framing a natural system, great difficulties are to be encountered, and imperfection of the system is necessarily to a certain extent involved in imperfection of the science. Based not upon one mere set of characters arbitrarily selected, but upon a consideration as far as possible of all characters which plants present, and not merely upon external forms viewed in themselves, but upon these and internal organization considered in their physiological relations, a natural system aims at exhibiting the real affinities which subsist in the vegetable kingdom; and evidently must be at all times liable to modification, and capable of improvement, as botanical science advances, either through the dis-

covery of new plantsor through phytotomical and physiological research: it also evidently requires the greatest scientific attainments and the highest powers of a philosophic mind. Nor is it one of the least of the practical difficulties, that the affinities of plants are not such as to constitute a simple lineal series, but that they may be viewed as a multitude of groups arranged around centers, and connected with each other upon different sides and by a great variety of ties.

Yet the rudiments of a natural system have always been sought after, and in some measure attained, when B. has been studied as a science—whenever it has become anything more than a mere acquaintance with a few plants and their names. The *genera* into which species are grouped by all botanists are natural, and are the basis upon which all classification proceeds in its further generalizations: So sensible was Linnæus of the importance of maintaining this character of the genera, that when a rigid adherence to his artificial system would have caused the division of a genus into parts, and the consequent separation of species very nearly allied, he kept the genus unbroken, and maintained the usefulness of his artificial system, to the student desirous of finding the names of plants, by referring from one of its classes or orders to another for species exceptional among those of their genus as to the number of their stamens or pistils, or their *diœcious, monœcious,* or *hermaphrodite* flowers.—The classification of species, however, in genera and larger natural groups, being a subject as much connected with other branches of natural history as with B., will more properly be treated in the article NATURAL HISTORY; and to that article also, and to the article SPECIES, we refer for all that our limits allow concerning some of the most interesting and difficult questions of science, the limits of species, the distribution of species, etc.

An important branch of botanical science is that which is called *geographical B.,* or the *geography of plants,* and sometimes *phytogeography.* It must be regarded as yet in its infancy, although a multitude of observations have been recorded in works of descriptive B., and by botanical travelers. It is the object of *geographical B.* to connect with the occurrence or prevalence of plants in particular countries a great variety of facts as to climate, altitude, geology, etc., and even facts of history. It aims at the establishment of great general laws, which, however, it has not yet been able to establish. Some account of the progress which has been made in this branch of B., and of the imperfect generalizations which have been reached, will be found in the article GEOGRAPHY OF PLANTS.

Another branch of botanical science which has recently sprung up, and has acquired great magnitude and importance, is PALÆONTOLOGICAL B., or FOSSIL BOTANY. The petrified fruits and wood, the beautiful impressions of ferns and palms, and other traces and remains of former vegetation, which appear in vast numbers and great variety in different strata of the earth's crust, present a most interesting field of scientific research. The study of the different kinds of fossil plants, and the comparison of them with existing species, belong strictly to the science of B.; the study of their relations to particular strata or formations, and so to particular periods in the physical history of the globe, belongs to geology. The study of fossil plants has proved exceedingly useful in guiding to just and philosophic views of the mutual relations even of species and groups still existing. See PALÆONTOLOGY.

The subject of the DISEASES OF PLANTS must be regarded as falling within the province of botany. It has scarcely yet been treated or studied as a distinct branch of science, although it has not been overlooked in its relation to vegetable physiology, with which its intimate connection is obvious, and it has received no little attention in its bearings on agriculture and other arts by which plants are made to supply the wants or minister to the comforts of man.

ECONOMIC B. includes all that relates to plants, considered with reference to these arts and to these uses. That part of it which relates to medicinal plants has been often separately and elaborately treated under the name of MEDICAL BOTANY. In the botanical articles of this work will be found notices of the more important plants affording food to man, and therefore cultivated in fields or gardens, in warm or in cold climates, and of those valuable for their timber, their fiber, or the dye-stuffs or medicines which they yield.

Having thus endeavored to sketch an outline of the science of B., we must refer to the articles PLANT, VEGETABLE PHYSIOLOGY, instead of attempting here to fill up a part of that outline by exhibiting the first principles of the science. It remains for us, in the present article, to give a very brief account of the history of B., and outlines of the systems of classification most deserving of attention.

We are informed that Solomon "spoke of trees, from the cedar in Lebanon even to the hyssop that springeth out of the wall." There is reason also to believe that Zoroaster devoted some attention to plants, and that this study early engaged some of the philosophers of Greece. The oldest botanical work which has come down to us is that of Theophrastus (q.v.), a pupil of Aristotle, who flourished in the 4th c. B.C. His descriptions of plants are very unsatisfactory, but his knowledge of their organs and of vegetable physiology may well be deemed wonderful, when we consider the low state of this branch of science throughout many centuries after his time. It was not, indeed, till after the rivival of letters in western Europe, that it was ever again studied as it had been by him. About four hundred years after Theophrastus, in the first c. of the

Christian era, Dioscorides of Anazarbus, in Asia Minor—a herbalist, however, rather than a botanist—described more than 600 plants in a work which continued in great repute throughout the middle ages, a sure proof how destitute that period must have been of any botanical science of its own. About the same time, the elder Pliny devoted a share of his attention to B., and his writings contain some account of more than 1000 species, but compiled from various sources without much discrimination, and mingled with many errors. Centuries elapsed without producing another name worthy to be mentioned in a history of botany. It was among the Arabians that the science next began to be cultivated, about the close of the 8th century. The greatest name of this period is Avicenna. Centuries again elapsed, a longer interval than before, during which it made no progress whatever. It was not till the beginning of the 16th c. that B. resumed its place as a science. The first to revive it was Otto Brunsfels, a German, who published in 1530 his *Historia Plantarum Argentorati*, or history of the plants of Strasburg, in 2 vols., folio, illustrated with cuts. He was speedily followed by Bock or Tragus, Fuchs or Fuchsius, and other Germans; by Matthiolus and Cæsalpinus in Italy; Dodœns or Dodonæus in the low countries; De L'Obel or Lobelius, a Dutch physician at the court of England; Gesner in Switzerland; Dalechampa and Moulins, or Molinæus, in France, and by many others, for B. now began to be prosecuted wherever learning flourished, and with great zeal and success. Chairs of B. were founded in universities, botanic gardens (q.v.) were established in many places, and travelers began to explore even remote parts of the world. One of the greatest names of the latter part of the 16th c. is that of L'Ecluse, or Clusius, who traveled through many countries, encountering great perils and hardships in pursuit of his favorite science, and was finally professor of B. at Leyden. The name of Dr. Turner, "the Father of English B.," belongs more to the 17th c. than to the 16th. The number of species known and described had increased, in the beginning of the 17th c., to more than 5000, but the study of them was much impeded by confusion of synonyms and by want of classification, whilst classification was rendered extremely difficult by imperfect knowledge of the structure and organs of plants. The foundations of a natural system of classification may be said to have been laid, in the latter half of the 17th c., by Dr. Robert Morison, a native of Aberdeen and professor of B. at Oxford, followed towards the close of the century by the celebrated Ray, one of the greatest naturalists that England has produced.

The application of the microscope in B. inaugurated a new epoch of the science, about the middle of the 17th century. Henshaw and Hook, both Englishmen, were among the first to employ this instrument to good purpose in the examination of the organs and structure of plants; but the greatest eminence belongs to the name of Grew, also an Englishman, a physician at Coventry, and to that of Malpighi, an Italian, perhaps still more celebrated for his anatomical than for his botanical discoveries. Vegetable physiology now began to be recognized as the highest department of botanical science.

In the latter half of the century, perhaps the most eminent name after Ray is that of Joseph Pitton de Tournefort, a French gentleman, who devoted his whole life to the pursuit of botanical science, and who must be particularly noticed in a sketch of the history of B., on account of a system which he proposed, and which was more generally received and employed than any other till the time of Linnæus. Another botanist of the same period, Rivinus, professor at Leipsic, gave to the world a botanical system which was received to some extent in Germany. Tournefort's system was partly natural and partly artificial; that of Rivinus was perhaps the most perfectly artificial that was ever proposed.

The science of B. made rapid progress during the 17th and 18th centuries, both by the extension of botanical research in different parts of the world, and the careful study of particular groups of families of plants. Its progress was promoted by the publication of many valuable descriptive works. Important discoveries were also made in vegetable physiology.

About the middle of the 18th c., the wonderful genius of Linnæus effected a great change in B., as well as in zoology. His name marks an epoch in the history of the science; not chiefly, however, in consequence of the new system which he introduced, nor even because of the discoveries which he made, but rather because he was able very thoroughly to make himself master of all that had been ascertained by his predecessors, and to exhibit it in lucid order. He gave also a great impulse to botanical studies by the enthusiasm with which he inspired his pupils. And among the benefits which he conferred on B., in common with zoology, not the least considerable was the introduction of trivial or specific names to be used along with the name of the genus as the designations of particular species.

From the time of Linnæus, the progress of B. during the remainder of the 18th c. became more rapid; and since the commencement of the 19th c., it has advanced with gigantic strides. A large space would be occupied by a mere enumeration of the names of those who have promoted it by their labors and discoveries. Some notion of what botanical literature has become, may be formed from the fact that Pritzel, in his *Thesaurus Litteraturæ Botanicæ* (Leip. 1847–51), enumerates about 15,000 publications.

Von Haller, an anatomist and philosopher, as well as a botanist, was, of all the contemporaries of Linnæus, the only one who could be regarded as his rival. Of all the

botanists of the latter half of the 18th c., the most deserving to be mentioned in the history of the science along with the great Swede, are Bernard de Jussieu, and his nephew, Antoine Laurent de Jassieu, who applied themselves with great earnestness to the study of the natural affinities of plants and the formation of a natural system, a work which Linnæus himself attempted, and of the importance of which he was so sensible, that whilst acknowledging the imperfect success of his endeavors, he declared his resolution to persevere in them to the end of his life. The Jussieus traced the outlines of a system which the greatest botanists since their time have not so much sought to change as to complete. Among those who have labored with greatest success in this work, must be mentioned De Candolle, Fries, Endlicher, Brongniart, Meisner, Von Martius, Lindley, and Brown. The botanist last named acquired by his work on the plants of New Holland, published in 1810, a high eminence, not on account of new plants which he described, but on account of the light which he threw upon the most difficult questions connected with the structure of plants and vegetable physiology. Many remarkable discoveries in vegetable physiology have recently been made by Link, Meyen, Schleiden, Von Mohl, Lindley, and others, some of them affecting what may be called the most fundamental principles of botanical science.

Since the days of Linnæus, great progress has been made in the examination of the B. of particular countries and districts, of which perhaps the least important result has been the discovery of very many plants unknown before. But our limits prevent us from noticing particular works in this department of botanical science, or those of botanical travelers, or of botanists who have devoted themselves to the study of particular groups of plants. And we can merely allude to the scientific associations, continually increasing in number and resources, by which the interests of this science are promoted, and to the magazines and other periodical publications devoted to it. However, we cannot but refer also to what may be deemed by some—but unjustly—matters of comparative insignificance, the introduction of B. into schools, and the publication of many works intended for the use of persons not very scientific. By the introduction of this or any similar branch of science into schools, not only may important educational purposes be served, but the young may be led to form a taste for the science which will impel them to its subsequent prosecution. There are few branches of science so easily made popular as B.; but they very much mistake its nature who suppose it to consist in a mere knowledge of the names of plants, or in a familiarity with the classes of an artificial system. What B. really is, and to what the true study of it tends, is better perceived if we consider that "there is not a flower that blows but has some beauty only unveiled to the minute inquirer, some peculiarity in structure fitting it to its destined place and purpose, and yet not patent to a casual glance." There is perhaps no branch of science which demands more than B. the application of the highest mental powers; and like every other, to him who truly prosecutes it—whether little or much—it brings in due measure an immediate reward in his own improvement and delight.

We proceed to exhibit an outline of the Linnæan system, the only artificial system which it appears necessary further to notice, and of the natural system by which it has been to a great extent superseded. The Linnæan system, however, is not entirely artificial. Its foundation may be said to be laid in the perfectly natural distinction between Phanerogamous and Cryptogamous plants—the former of which Linnæus divided into 23 classes; whils the constituted the latter, corresponding to the Acotyledonous plants of Jussieu, into his 24th and last class, *Cryptogamia*. In the other classes, he took the characters from the parts of fructification: this he defined as having no stamens or pistils distinctly visible, and gave it a name, *Cryptogamia* (Gr. *kryptos*, concealed, and *gamē*, marriage), in accordance with this definition, modestly refraining from a confident assertion of the absence of stamens and pistils. Of the 23 classes of phanerogamous or phenogamous plants (Gr. *phaneros*, manifest, and *phaino*, to show), the characters of all are taken from the stamens; and those of Classes I. to XI., simply from the number of them; these classes, however, not including plants exhibiting the peculiarities with reference to which the remaining classes are constituted. Thus Class I., *Monandria* (Gr. *monos*, one, *aner*, a male), consists of plants the flowers of which have only one stamen; Class II., *Diandria* (Gr. *dis*, twice), of those with two stamens; Class III., *Triandria* (Gr. *treis*, three), of those with three stamens, and so on; Class IV., *Tetrandria* (Gr. *tetras*, four times); Class V., *Pentandria* (Gr. *pente*, five); Class VI., *Hexandria* (Gr. *hex*, six); Class VII., *Heptandria* (Gr. *hepta*, seven); Class VIII., *Octandria* (Gr. *octo*, eight); Class IX., *Enneandria* (Gr. *ennea*, nine); Class X., *Decandria* (Gr. *deka*, ten)—until, in Class XI., *Dodecandria* (Gr. *dodeka*, twelve), the number of the stamens is less definitely fixed, and plants are included in it having more than ten, and fewer than twenty stamens. Then follow two classes—Class XII., *Icosandria* (Gr. *eikosi*, twenty), and Class XIII., *Polyandria* (Gr. *polys*, many)—which have numerous stamens, but differ in their being inserted on the calyx in the former class, and on the receptacle in the latter, characters essentially natural, as are those also of most of the remaining classes. Classes XIV., *Didynamia*, and XV., *Tetradynamia* (Gr. *dynamis*, power), are distinguished by having the stamens of different lengths—the former having two long and two short stamens, the latter, four long and two short. Class XV. agrees with the great natural order *Cruciferæ*. Class XVI., *Monadelphia* (Gr. *adelphos*, a brother), has

the stamens united by the filaments in one bundle; Class XVII., *Diadelphia*, has the filaments united in two bundles, or one free and the rest united; Class XVIII., *Polyadelphia*, has them united in more than two bundles. In Class XIX., *Syngenesia* (Gr. *syn*, together, and *genesis*, generation), the stamens are also united, but by the anthers instead of the filaments. This class nearly agrees with the great natural order *Compositæ*, and consists chiefly of plants having compound flowers. Class XX., *Gynandria* (Gr. *gyne*, a female), consists of plants in which the stamens grow out of, or are united with the pistil. Class XXI., *Monœcia* (Gr. *oikos*, a house), consists of plants having the stamens and pistils in different flowers on the same plant; Class XXII., *Diœcia*, of those which have the male and female flowers on different plants; Class XXIII., *Polygamia* (Gr. *polys*, many, *gamos*, marriage), of those having the stamens and pistils in the same or in different flowers on the same or on different plants.—The classes are divided into *orders*, which are constituted on various grounds. The orders of the first 13 classes are strictly artificial, their characters being found simply in the number of the pistils, according to which they are named *Monogynia* (Gr. *monos*, one, *gyne*, a female), *Digynia*, *Trigynia*, etc.; *Dodecagynia*, including all with 12 to 19 pistils, and *Polygynia*, all with 20 and upwards. The orders of Class XIV. are constituted on entirely different grounds, and are two in number, *Gymnospermia* (Gr. *gymnos*, naked, *sperma*, a seed), and *Angiospermia* (Gr. *angeion*, a vessel)—the former "having naked seeds" (or rather the fruit formed of 4 *achenia*), the latter having the seeds in a capsule. The orders of Class XV. are in like manner founded upon the fruit; those of Classes XVI., XVII., and XVIII. upon the number of the stamens; as are also those of Classes XX., XXI., and XXII.; those of Class XIX., chiefly upon characters taken from the florets of compound flowers; those of Class XXIII., upon the circumstance of the hermaphrodite, male and female flowers being found on one, two, or three plants; whilst the orders of Class XXIV. are strictly natural—*Filices* (or ferns), *Musci* (or mosses), *Algæ*, and *Fungi*.

The student may acquire a pretty complete knowledge of the Linnæan artificial system, without knowing much in reality of B.; but, even in beginning to learn the natural system, he must learn some of the first principles of the science. Jussieu followed Ray in dividing plants into three great primary divisions—*acotyledones* (q.v.), *monocotyledones* (q.v.), and *dicotyledones* (q.v.); having respectively no cotyledon or seed-lobe, one cotyledon, and two cotyledons. And, however the names may be changed, or characters assumed from other parts of the plant, these great divisions of the vegetable kingdom still subsist; the *acotyledonous* plants being also, according to characters taken from the stem, *acrogenous* (q.v.); the *monocotyledonous* plants, *endogenous* (q.v.); and the *dicotyledonous* plants, *exogenous* (q.v.). Endlicher is the only botanist of great note who has attempted to make primary divisions of the vegetable kingdom essentially different from those indicated by Ray, and his attempt has not commended itself to general approval. De Candolle gave expression to an important truth in botanical science, when he united the two divisions of monocotyledonous and dicotyledonous plants under the common title of *vascular plants*, in opposition to acotyledonous or *cellular* plants; the vascular plants being the *phanerogamous*, and the cellular the *cryptogamous*. Lindley has endeavored to modify the natural system by dividing the *asexual* or *flowerless* (cryptogamous) plants into the two classes of *thallogens*—with the stem and leaves undistinguishable—and *acrogens*, with the stem and leaves distinguishable, thus limiting the term acrogens to those which have a distinct stem; and in like manner dividing the *sexual* or *flowering* (phanerogamous) plants into five classes, viz., *rhizogens*, with fructification springing from a thallus; *endogens* and *dictyogens*, with fructification springing from a stem, the wood of which is youngest in the center, and the seed with a single cotyledon—the former having parallel-veined permanent leaves, and the wood of the stem always confused; the latter having net-veined deciduous leaves, and the wood of the stem when perennial arranged in a circle around a central pith; *gymnogens* and *exogens*, having the wood of the stem youngest at the circumference, and always concentric, the seed with two or more cotyledons; the former having the seeds quite naked, the latter having them inclosed in seed-vessels. But others generally prefer the simpler division of phanerogamous or vascular plants into monocotyledonous or endogenous, and dicotyledonous or exogenous, the former including Lindley's endogens and dictyogens, the latter his exogens, gymnogens, and rhizogens; although the latter have only a provisional place assigned them, in the absence of well-ascertained views of their structure.

One of the great advantages of the natural system is, that the plants which it brings together are very generally found to agree in their properties, as well as in their structural characters. There are, indeed, species which, in respect of their properties, are anomalous or exceptional in the genera or orders to which they belong; but these exceptions do not invalidate the general rule, according to which we expect the most deadly poisons in the order *loganiaceæ*, bland mucilage and useful fiber in *malvaceæ*, wholesome succulent herbage along with a certain amount of acridity or pungency in *cruciferæ*, etc., etc. The knowledge of the properties of genera and orders is of great use in guiding inquiry, and it is thus that modern science attains in rapid succession to discoveries important in their practical relations.

In the determination of the intermediate subdivisions of the natural system, botanists have not yet been so successful as with regard to these primary divisions, and the ascer-

tainment of the characters and limits of lowest subdivisions—orders, tribes, and genera. Great difficulty has been found in arranging the orders in natural groups, although the attempt, very necessary to a complete system and a just exhibition of nature, has been very assiduously and perseveringly made by Meisner, Endlicher, Lindley, and others of the greatest botanists of the present age.

BOTANY, Fossil, a study almost unknown until the beginning of the 19th c., but now of much importance in connection with palæontology. Besides the usual classification of plants there is generally recognized a sixth class called protophytes, which embrace microscopic eryptogamous plants. These are diatoms and desmids. In botany, as in the animal kingdom, the simplest forms are reckoned the lowest; and, as in the history of animal life, we find that the lower forms of plants appeared first. This is proved by the fact that such forms are found in the oldest fossiliferous strata, the higher groups appearing only in later formations, the present flora being the most highly organized of any. It is known that plants preceded animals, for animals depend upon plants for food, while plants had power to assimilate inorganic substances. With regard to fossil specimens it must be remembered that as the continents came up out of the sea, and as all fossiliferous strata were deposited under water, therefore aquatic plants and animals were more likely to be preserved than animals and plants of the higher lands. In later geological ages the plants have been for the most part terrestrial, while the animals have been in far greater proportion aquatic. Animals also, oftener than plants, have some imperishable portions, and so the specimens of extinct animals are more nearly complete than are those of plants. Remains of marine fossil animals are found in the drift deposited by the sea in successive invasions of the land; and such invasions have been followed by periods of immense duration in which the sea was far away from the invaded land. Within these indefinite periods no record was made, unless in the deep water of the sea or on the shores of other lands invaded during the interim. Therefore for any single country the records of marine life exist in a series of sections separated from each other by blanks covering enormous periods of time. The relations of extinct animals are, consequently, necessarily obscure. But the succession of land plants may have been unbroken, or nearly so; in any event, it is much nearer perfection than in the case of marine animals. It is therefore conceded that the records of plant life found in the sea-shore deposits and the lake beds of the earth will throw much light on the questions of evolution and the origin of species. An idea of the present state of knowledge in respect to fossil botany may be gathered from the following statement of some of the discoveries and deductions thus far made.

The protophytes are identified only with the recent deposits. Their absence from the Palæozoic rocks may be explained by the fact that only such as secreted calcareous or silicious crusts or shells could under ordinary circumstances be preserved. The shields of diatoms are more easily soluble than most forms of silica, and perhaps some of the older beds of flint received their material from this source. Some of the small plants which secrete lime and are commonly called algæ might be considered protophytes. These are and have been abundant in our seas, and may have contributed to the formation of the beds of fossiliferous limestone which make up so much of the Palæozoic rocks. There are tertiary deposits made up of the shields of the diatoms at Monterey, Cal., and near Richmond, Va. The desmids, which are non-silicious, are often found in flint of the cretaceous age, but diatoms under similar circumstances are rare.

The algæ (*hydrophyta*, or *thallogens*) abound in all the oceans and seas, and are discovered in all strata from the lower Silurian upwards. But in the lower Silurian the only plants certainly traced are sea-weeds. Plants found in the Cambrian rocks are described as of the genus *eophyton*. In the Trenton limestone are several species of algæ. Sea-weeds are common in the upper Silurian, the most important being a fossil of the Medina sandstone. In the same strata is the genus of fucoids called *spirophyton*, which runs through the Devonian and carboniferous systems, and is called the "cock's-tail fucoid." In the upper Devonian and lower carboniferous strata is found a group of singular formation called *dictophyton*, and another equally remarkable, called *uphantænia*. In later formations algæ become numerous and gradually approach the forms of the present age. About 50 genera and 150 species have been described.

Lichens, which are so abundant now, are scarcely known in a fossil condition. But as they are exclusively terrestrial plants, they were less likely to be fossilized than the aquatic *thallogens*. It is considered that the lichens were much less abundant in the carboniferous age than now. The only known fossil species were found in amber and in the tertiary lignites. Those in amber are of the same genera and for the most part of the same species with the lichens now common in America and Europe.

Probably because they are terrestrial, and most of them soft and easily perishable, fungi are almost as rare as lichens in the fossil strata. A considerable number of fungi have been described. They are almost all from the tertiary; but some species have been found in the coal-beds of Saxony, and a few have been found in amber. It is believed that some species described are not fungi, but shells, or fish scales.

Plants of the group *anogens*, including *hepaticæ* and the mosses, now form a large part of our vegetation. With an expanse of development as wide as the earth, and in

such vast abundance everywhere, it seems strange that no trace of *anogens* has been found in the older geological formations. But in the tertiary formation both mosses and liverworts are found in considerable abundance, particularly in amber and lignites, and to the formation of the latter they appear to have contributed. Those preserved in amber served to show that nearly the same species are now growing in various parts of Europe. It is believed that the liverwort known as *marchantia palydrosphia* is the most widely distributed of living plants. The absence of *anogens* in the ancient flora shows that those plants, though low in the scale of plant life, are of quite modern date.

There appears to be some reason to believe that the *acrogens* (ferns, equiseta, and lycopods) were the first forms of land vegetation on the earth. They are still represented, but are nowhere predominant, and in general they are insignificant among local living forms. They were formerly much more important, but hundreds of species have died out. Of the three orders united in this class, the lycopods seems to have been the earliest in point of time, and earliest in their subsequent development. They are now represented by various species of lycopodium, or ground-pine, most of which are small. The first lycopods are found in the upper Silurian rocks of Canada, England, etc. These were the forerunners of the large scaly-trunked trees of the carboniferous flora, in which flora they exceeded all other forms of vegetation. At the close of the palæozoic age the lycopods seem to have almost disappeared. No specimen of the group has been found in the mesozoic or tertiary rocks. The ferns made their first appearance in the Devonian strata, and acquired greater importance than they have at the present time. In the middle and upper Devonian tree-ferns were numerous, and of greater dimension than any now living. Of the forms of the upper Devonian and carboniferous strata several hundred species have been described, and there are reasons to believe that they formed a much more highly organized, diversified, and beautiful group of plants than can be found in the fern-flora of to-day. In the mesozoic and tertiary rocks remains of ferns have been found; but ferns reached their highest development in the carboniferous period. The equiseta, which now exist only in the form of scouring rushes, in the carboniferous and Devonian ages grew nearly to the size of forest trees, and in numbers were among the most important of the flora. In the mesozoic ages species of this genus exiisted, having trunks 6 in. in diameter. In the tertiary age the equiseta were larger than now, but were an unimportant portion of the flora of the time. The order of acrogens show a history in contrast with that of other cryptogami. They began very early in the earth's history, acquired a profuse development, and kept their standing through two geological ages. Then that standing was suddenly lost, and thenceforward their course has been downward, until from lordly trees they have degenerated to rushes, and lost all importance in botanical rank and in scientific consideration.

Quite the opposite are the facts in regard to the great group of *endogens*, among which are the grasses, palms, lilies, etc., including many of the loveliest forms of vegetable life. They include also the grains commonly called cereals, and are thus not only ornamental, but highly useful. They are of comparatively modern date. Few traces of them have been found in palæozoic rocks, but they seem to have existed at least as flowering plants in the carboniferous age. In the triassic, jurassic, and cretaceous formations they are represented by many genera. Palms appear in the cretaceous formation, the oldest representative being the fan-palm now growing in the southern United States. In the tertiary era this flora rose to great importance, and remnants are found of many species of grasses, sedges, and lilies. It appears, therefore, that the endogens are of quite modern date, beginning in the mesozoic era, the inferior families coming in at a later period.

The *exogens*, now forming much the larger part of the vegetation of the globe, belong to the present or to the immediately preceding geological era. No actual traces of angiosperms, the highest division of the exogens, have been found further back than the cretaceous rocks. Commencing in that era, they spread with great rapidity, developed in remarkable force and variety, and before the close of the epoch they had become the predominating type of vegetation, which gave the flora of the earth very nearly its present appearance. In the tertiary epoch many additions were made, comprising the most beautiful and useful of flowers and fruits, producing plants useful in supplying the animals then coming to development, and finally for supplying man. There is quite a different history for the inferior order of exogens, the gymnosperms, the conifers, and the cycads. The conifers seem to have been among the first of terrestrial plants, beginning far back in later epochs of the upper Silurian age. In the Devonian they attained large size, as the petrified trunks found in middle Devonian rocks have proved. In the carboniferous age, conifers were abundant, producing forests much like the pine forests of the present day. In the tertiary age, the conifers reached their highest development in the "mammoth trees," the "red wood," etc., of which remarkable specimens are still to be seen in California. The pines and firs began in the cretaceous age, and have since been increasing in importance, at present constituting by far the larger part of the coniferous vegetation of the globe. Yews appeared in the tertiary period, *podocarpus* in the mesozoic, *larix* in the tertiary, *arbor vitæ* in the mesozoic, *taxodium* in the middle tertiary, the ghinko (which has now but a single representative) in the cretaceous. The cycads appeared in the carboniferous age, and in the mesozoic age became one of the

most characteristic forms of vegetation. Then they displaced and succeeded the acrogens of the coal-floras, and gave their name to the "age of cycads," extending from the beginning of the triassic to the middle of the cretaceous age. They were in turn displaced by the conifers. In the tertiary age the cycads filled about the same position as now.

Of the angiosperms much will be found under the title BOTANY (see *ante*). Their history comprises the larger part of modern botany. They appear in vast numbers quite abruptly in the upper part of the cretaceous formation. Many of the genera now living formed the forests of that period, and the fossil remains show that their appearance was much the same as now. Among the living genera represented were the oak, poplar, plane, willow, beech, sassafras, magnolia, fig, maple, walnut, tulip tree, etc. The tulip-tree has but a single living representative, yet the genus began in the cretaceous age, in America; and in the miocene tertiary age a tree nearly like it grew in Greenland, Iceland, and in Europe down to Italy. The sassafras, having now but one species in America and one in the East Indies, dates back to the cretaceous age, and was the companion of the tulip-tree in Greenland and elsewhere. Magnolias, so grand a feature of American forests, were common in Europe during the tertiary period, but none are native there now. The fast-disappearing specimens, with the lone remnants of gigantic growth of the Yosemite, remind us of the magnificent arborescent flora of the American continent in ages long gone by.

It is not easy to define *ages* in botany otherwise than by ages in geology. No trace of plants has been found in eozoic rocks. These rocks, however, contain no animal fossils, and it is supposed that if there had been deposits of either vegetable or animal matter, the metamorphism of the rocks is so absolute that no traces would be likely to remain. But beds of graphite found in the Laurentian rock-beds are by some scientists considered to indicate a vegetable origin; and one writer suggests that they may be of animal origin. Fucoids are said to have been found in the Cambrian rocks in England; and in the same rock in Sweden, and certain rocks in Wales, plant remains described as exogens have been found. Their character, however, is doubtful, and affords no real proof of development higher than that of sea-weeds. Fucoids are abundant in the lower Silurian, but usually with little or no trace of structure. There seems to be no satisfactory evidence of the deposit of land plants in the lower Silurian strata. Coming to the upper Silurian, we find the greater part of the plants to be sea-weeds. But here and there discoveries and indications tend to show the existence of land plants at about the end of the Silurian age. In the Devonian rocks fucoids are common. Tree-ferns have been found in the corniferous limestone of Ohio, indicating the existence of a highly organized flora on the land. In New York, Canada, and elsewhere, remains of an abundant flora have been found in the middle and upper Devonian rocks. The remarkable feature of Devonian flora is the prevalence of conifers and tree-ferns. The vegetation of the carboniferous age (age of coal) is important, but has been often described. More than 500 specimens of plants or parts of plants have been described. Much the greater portion consists of ferns, but few of them were arborescent. Next come the lycopods, then the equiseta. Of the latter group some were arborescent, and some were aquatic. The cycads, also, were represented; and the endogens, the latter by a few flowering plants. Conifers growing to the size of modern pines were abundant, but they were highland trees, and not likely to be found in coal-deposits. Many fossil fruits have been found with the coal plants, such as nuts of conifers and reed-vessels of cycads.

Coming to the triassic flora of the mesozoic age there is a radical change, both with regard to flora and fauna. Ferns were numerous, but different from those found in the coal-beds, and less plentiful. The cycads are the prominent feature of triassic vegetation; they were so numerous and conspicuous as to give rise to the title "reign of the cycads." This branch of fossil botany has not been much studied in America, but some valuable collections have been made. The most remarkable of American plants of this period are cycads, and great monophyllous ferns. In some places petrified trunks of coniferous trees are abundant, proving that forests of very large trees covered some portions of the continent at that period. But so far no traces of angiosperms have been found among triassic plants, nor have any Jurassic plants, so common in Europe, been discovered in this country.

The cydaceous flora appears to have remained with no particular change during the early part of the cretaceous era. About the commencement of the lower cretaceous strata, however, the "reign of angiosperms" began, and in the cretaceous sandstones of New Jersey and of the west the remains of 100 species of arborescent angiosperms have been found, with few ferns and hardly any cycads among them. The facts show that the continent was covered with forests of broad-leaved trees, rivaling in size and beauty those of the present time; that among those old trees were oaks, magnolias, sycamores, willows, beeches, and others now common. The upper cretaceous deposits of Colorado and other territories contain beds of lignite, and many foreign plants. About 250 specimens, of which many are single leaves, have been found. The coal strata of Vancouver's island contain many signs of the leaves of angiosperms.

In the tertiary age, the angiosperms predominate, and the indications are that the flora was derived directly from that of the cretaceous era, the tertiary flora in turn giving birth to that of the present day. No traces have been found in this country of the

flora of Europe of the eocene period. During the miocene period, fan-palms grew as far north as Canada, indicating that the region of the St. Lawrence then had a climate as warm as that of the gulf states at the present time. In the miocene tertiary period, the part of the continent now knows as British America and Alaska was covered with luxuriant vegetation, even to the shores of the Arctic ocean. In Greenland and Alaska many specimens of arborescent plants have been found. The similarity of many of these species to those found in Europe lead to the presumption of a land connection between the two continents; and the similarity of the flora of Japan with that of America would seem to indicate a land connection on that side also. The pliocene flora of America presents no very marked changes from that of the miocene, except in approaching more nearly to the flora of the present time. In the glacial era, the tertiary flora was forced southward, or destroyed. After the modification of temperature, the boreal plants, which in the ice period had covered the lowlands, moved northward or climbed the hills and mountains to find a natural temperature. The kindred character of alpine species in often widely separated places shows this fact.

After the manner of the geologists, the learned in fossil botany may divide the ancient flora into "ages," of which there are four: 1. The *age of thaliogens*, including the Cambrian and Silurian divisions of geology, during which time sea-weeds were almost the only form of plants. 2. The *age of acrogens*, in the Devonian and carboniferous eras of geology, when ferns, etc., attained their wonderful development in size and number. 3. The *age of gymnosperms*, from the beginning of the triassic to the middle of the cretaceous era, when the cycads and conifers were over all the earth, and of greater relative importance than at any time before or since. 4. The *age of angiosperms*, from the middle of the cretaceous to the present time, of course including all existing flora. See PALÆONTOLOGY, *ante*.

BOTANY BAY, a haven of New South Wales, in lat. 34° s., and long. 151° 15′ e., discovered by Cook, on his first voyage, in 1770, and named by him from the great number of new plants in its vicinity—a characteristic, however, rather of Australia in general than of this particular locality. In 1787, it received England's first penal colony in the east; and though it was supplanted the very next year by Port Jackson, a vastly superior harbor immediately to the n. of it, yet it long continued to be the popular designation, not merely of this convict settlement, but of the Australian convict settlements generally. On the shore of B. B. there was erected, in 1825, a column to the memory of that eminent French navigator, the unfortunate La Perouse.

BOTETOURT, a co. in s.w. Virginia, on the James river; intersected by the Atlantic, Ohio and Mississippi railroad; 500 sq.m.; pop. '70, 11,329—3163 colored; in '80, 15,750; the Blue ridge is its s.e. boundary; Middle mountain is on the n.w. border, and the Peaks of Otter are on the Bedford co. line. Cereals and tobacco are the chief productions. Co. seat, Fincastle.

BOTETOURT, SIR NORBORNE BERKELEY, Lord, 1717-70: an English statesman, governor of the colony of Virginia in 1768, dying there two years later. He favored the colonists and opposed parliamentary taxation. He was the last of the barons of Botetourt.

BOTH, JOHN and ANDREW, two celebrated painters, who, being united in their works like Beaumont and Fletcher, are, like them, usually spoken of together, were born at Utrecht, where their father was a painter on glass—John in 1610: the date of Andrew's birth is not known. After studying under Abraham Bloemart, the brothers went to Italy, where they soon won for themselves a high reputation. John painted landscapes, adopting Claude for his model, while Andrew filled in the figures after the style of Bamboccio, and in so careful a manner that the pictures looked like the work of one hand. John's landscapes are characterized by delicious warmth of sky, softness of distance, and general truthfulness to nature; even the different hours of the day may be distinguished in some of his best pictures, so careful are his tints. The works of the brothers are still in great repute, and bring high prices whenever they are offered for sale. One of the brothers was accidentally drowned in a canal in Venice in 1650; the other brother then settled in Utrecht, where he died six years afterwards.

BOTHIE (from the Gaelic *bothag*) signified originally a humble cottage or hut, but for a considerable number of years the term has been more popularly applied to a barely furnished, generally uncomfortable habitation for farm-servants. Though bothies are principally confined to the eastern and north-eastern counties of Scotland a few have spread over a much wider area. The bothie, strictly speaking, of modern times is situated either under the same roof as the stable, or, oftener, at a short distance from the steading. While the cubic contents are invariably disproportionate to the number of inmates, the furnishings are of an uninviting, sometimes actually repulsive character. One long roughly manufactured table, a few long stools, a chair or two, a number of victual bunks, a few wooden cups or bowls, and a pot or two, constitute the bulk of the fittings. The inhabitants are generally unmarried men, who frequently have their own food to prepare. Some of the larger farmers afford a woman for cooking and cleaning the bothie. Huddled together in this unnatural way, without the refining influence of the heads of families or the female sex, it is not surprising that the inhabitants of the

bothie often acquire boorish and sometimes immoral habits. Public moralists decry the bothie vehemently. The men themselves do not raise their voice loudly, if at all, against it; and some influential farmers (amongst whom was the late Mr. M'Combie) seem to regard it, if an evil, as a necessary one, in present circumstances. The bands of Irish and Highland females living together in the e. Lothian cottages, may be ranked as bothieites, and do not strengthen the argument for the general system. Though the bothie system is only one of several foul blots on the agricultural escutcheon affecting the laborers, it is diminishing, as farm cottages increase, and must soon, under the pressure of public opinion and the growing desire for social elevation, be reduced to a minimum, if not entirely abolished.

BOTHNIA, the name formerly given to a country of northern Europe, extending along the e. and w. shores of the gulf of Bothnia (q.v.), the eastern portion now being comprised in Finland (q.v.), and the western forming the Swedish governments of Pitea and Umea.

BOTHNIA, GULF OF, the part of the Baltic sea which lies to the n. of the isle of Aland, having on its eastern shore Finland, on the western, Sweden and Lapland, with Tornea for its northern limit. It extends from lat. 60° to 66° n., and long. 17° to 25° 35′ e., its greatest length being about 400 m., and its average breadth 100 m. Its depth varies from 20 to 50 fathoms, but both along its shores, and in the middle, are many small islands, sand-banks, rocks, and cliffs, called *skaers*, which render the navigation difficult; though on the whole it is less dangerous than other parts of the Baltic, and has many good harbors. The rivers which fall into this gulf, both from Sweden and Finland, are numerous; and the waters of the gulf itself are but slightly salt. In winter, it is usually so hard frozen that it can be crossed by sledges.

BOTHRIOCEPH'ALUS (Gr. *bothrion*, a little pit, and *cephale*, a head), a genus of intestinal worms, belonging to the order of *cestoid worms* (q.v.), and included, until recently, in the genus *tænia* (tape-worm, q.v). The head in this genus is not furnished with four sucking disks, as in the true tape-worms, but with two lateral longitudinal hollows, which seem to serve only for adhesion by means of a partial vacuum, and to have nothing to do with nutrition. Nourishment is indeed supposed to be obtained entirely by the imbibing of fluids through the entire length of the worm; and whilst this process of imbibing takes place, there is also an exudation—as *exosmose* accompanies *endosmose* (q.v.) in the roots of plants—of peculiar oleaginous drops, which may probably be in part the cause of the injurious effects produced by these worms upon the health of the animals infested by them. The species of B. are very abundant in predaceous fishes, and occur more sparingly in fish-eating birds; the immature and sexless young being found in fishes and inferior aquatic animals, either in peculiar cysts, or in the intestinal canal. Sticklebacks are often seen distended to an unusual size by a species of B. which lies free in the cavity of the abdomen; but in the stickleback its joints and sexual organs always remain undeveloped; it is only when the stickleback has been digested in a bird's stomach, that the B., released, and finding itself at last in suitable circumstances, acquires its mature form, becoming an inhabitant of the bird's intestines. Only one species of B. occurs in man, *B. latus*, which is at once distinguished from the common tape-worm by the different form of its segments, but has been often confounded with another species of tape-worm, under the name of broad tape-worm. The segments are much broader than they are long, and each contains organs of reproduction. The worm is strictly androgynous. It is scarcely known in Britain, but is of frequent occurrence in some parts of Europe, and sometimes attains a length of 15 ft. or upwards; and a coil of these worms is not unfrequently expelled at once from the patient. The B. is, however, much more easily expelled than the true tape-worms. The same means are employed. The geographical distribution of this worm, which is most frequent in low marshy countries, has led to the conjecture, that its youngest brood may inhabit some of the smallest aquatic animals, and that it may find its way into human beings by their eating salads, fruit which grows near the ground, or the like.

BOTHWELL, a co. in Ontario, Canada, on lake Erie and St. Clair river; traversed by the Great Western railway; 547 sq.m.; pop. '71, 20,701. Petroleum is one of the chief productions.

BOTHWELL, a small village in Bothwell parish, in Lanarkshire, on the right bank of the Clyde, 8 m. e.s.e. of Glasgow. The river is here crossed by the celebrated bridge, the place of the bloody encounter between the Covenanters and Monmouth in 1679, when the former were defeated. Near the village are the magnificent Norman ruins of Bothwell castle, at the foot of which the Clyde washes the fine scenery of "Bothwell bank," celebrated in Scottish song. Pop. '71, 1209.

BOTHWELL, JAMES HEPBURN, fourth earl of, was b. about 1526. On his father's death in 1556, he succeeded to the great inheritance which made the earl of Bothwell the most powerful noble in the s. of Scotland. At first, he opposed the reformation party, but on their accession to power he easily changed his politics; and, in 1561, formed one of the deputation of lords sent to convey the youthful queen of Scotland to her kingdom. He was shortly after made a privy-councilor; but his violence and misconduct soon became intolerable, and he was ordered to quit Edinburgh. In Mar.,

1562, he and the earl of Arran were committed to the castle for conspiring to seize the queen's person. B. made his escape, was recaptured at Holy island, again got free, and sailed to France. He speedily returned, but finding Moray close on his trail, embarked for the continent. Not appearing at his trial, he was outlawed. In 1565, after the queen's marriage with Darnley, he re-appeared, and having strongly espoused her cause against Moray and his party, was suddenly restored to favor, and even high influence. In Oct., 1566, while performing a judicial tour in Liddesdale, he was attacked and wounded, and the queen manifested her interest in his danger by riding 20 m. and back to see him, a journey which brought on a dangerous fever. At Craigmillar, some time after, B. attempted, unsuccessfully, to overrule her objections to a divorce from Darnley. A more thorough-going method was open to him, and on the night of 9th Feb., 1567, Darnley was blown up at the Kirk of Field. The public voice loudly charged B. with the murder, but he was not formally indicted till the 28th March. He came to the trial attended by 4000 followers, and received an easy acquittal. Two days after, he carried the sword of state before the queen at the opening of parliament, and at its close, all his lands and offices were confirmed to him, in consideration of his "gret and manifold gude service done and performit not only to her hienes' honour, weil, and estimatioun, but alsua to the comone weil of the realme and leiges thairof." At a supper on the following night, the leading nobles signed a bond approving of Bothwell's acquittal, and commending him as a fit husband to the queen, pledging themselves to stand by him. On the 26th April, B., accompanied by a strong force, carried off the queen to Dunbar castle; on the 6th May he was divorced from his wife; and on the 15th his marriage with Mary was solemnized at Holyrood. He had previously been created duke of Orkney. His guilty triumph was very short; the wrath of the nation was roused; at the end of one month, Mary was a prisoner in Edinburgh, and B., pursued in his voyage to the Orkneys, fled to Denmark. There he was seized, imprisoned, and died in 1576, leaving no heirs. His titles and estates were forfeited to the crown.

BOTOCU'DOES, or AYMBORES, a Brazilian people on the Rio Doce and Rio Parde, who are said to resemble Chinese. There are about 4000 of them; brave but treacherous, and troublesome to the government. They have the hideous custom of wearing a block of wood in the lower lip, forcing the lip to project 2 or 3 in. in a right angle to the jaw; they also wear great wooden ornaments in their ears. All the B., except a few who are civilized, go naked.

BOTONÉ, or BOTONNY. In heraldry, a cross botoné is a cross of which the ends are in the form of buds or buttons.

BOTOSHAN', or BOOTUSHA'NI, a city in Roumania, 60 m. n.w. of Jassy; pop. '66, 28,117. It contains a hospital and many churches and synagogues, and is the seat of an important fair.

BO TREE, the name given in Ceylon to the PEEPUL (q.v.) of India (*ficus religiosa*). It is held sacred by the Buddhists, and planted close by every temple, attracting almost as much veneration as the statue of Buddha itself.—The B. T. of the sacred city Anaradjapoora, is in all probability the oldest tree in the world, of which the age can be ascertained by historical evidence. It was planted in 288 B.C., and sir James Emerson Tennent, in his work on Ceylon, published in 1859, gives reasons for believing that the tree was then really the wonderful age of 2147 years; and refers to historic documents in which it is mentioned at different dates, as 182 A.D., 223 A.D., and so on to the present day. This tree is invested, in the estimation of the Buddhists, with wonderful sanctity. "To it," says sir James, "kings have even dedicated their dominions in testimony of their belief that it is a branch of the identical fig-tree under which Gotama Buddha reclined at Uruwelaya when he underwent his apotheosis." Its leaves are carried away as treasures by pilgrims; but it is too sacred to be touched with a knife, and therefore they are only gathered when they fall.

BO TREE, PEEPUL, the sacred fig-tree of Ceylon and Hindustan, greatly venerated by Buddhists. It bears a small fig of litte value, but its sap is rich in caoutchouc. The tree is a favorite haunt of the lac insect, and a great quantity of lac coloring matter is gathered from the branches. There is a B.T. in Ceylon which it is supposed was planted nearly three centuries before our era.

BOTRY'CHIUM, a genus of ferns, of the division *ophioglossea*, having the *spore-cases* (or seed-vessels) distinct, sub-globose, clustered at the margin, and on one side of a pinnated *rachis* (an altered frond), 2-valved, without any trace of an elastic ring, and opening transversely. The only British species *B. lunaria*, MOONWORT, a little plant, pretty frequent in dry mountain pasture, but not applied to any particular use. A species more worthy of notice is *B. virginicum*, of which the geographical distribution is very remarkable. It abounds in many parts of the southern states of America, the mountains of Mexico, etc., in Australia, in some parts of Asia, as the Himalaya mountains; and is found also in Norway, although in no other part of Europe. It is large and succulent, and is boiled and eaten in the Himalaya, in New Zealand, etc. It is called RATTLESNAKE FERN in some parts of America, from its growing in places where rattlesnakes are found.

BOTRY'TIS, a genus of fungi, of the division *hyphomycetes*, containing many of the plants commonly called MOLD (q.v.) and MILDEW (q.v.). The plants consist of a *mycelium* (see FUNGI) of more or less entangled threads, which are composed of rows of cells, with shoots of the same nature rising up from them, and bearing the fructification at their extremity. Some of them attack the fibers of vegetable fabrics, such as linen and cotton, in damp places, the decayed stems of plants, decaying fruit, etc. Some are found on living animal tissues, whether always previously diseased or not is a question still unsettled, although the probability appears to be that they make their appearance only where there is already disease, which, however, they modify or entirely change. A remarkable species of this section of the genus is the MUSCARDINE (q.v.), or SILKWORM ROT.—A section of the genus, in many respects of particular interest, and which some botanists have endeavored to separate into a distinct genus, consists of species which grow among living vegetable tissues. The threads of the *mycelium* creep among the loose cells of the under side of the leaves, and send up their fertile shoots through the stomata (see LEAVES and STOMATA). Many of the species are extremely destructive to particular plants, as *B. parasitica* to turnips. But *B. infestans* is, of all the species, the subject of greatest interest, the potato disease being confidently ascribed to it by some observers, among whom is sometimes named Mr. Berkeley, and the opinion of no living botanist is entitled to greater respect upon a point connected with this branch of the science; but Mr. Berkeley himself states his opinion very guardedly. "The decay of the leaves and haulm in the potato murrain," he says, "is certainly due to *botrytis infestans;* and its appearance in the diseased tissues of the tubers, when exposed to the air, makes it at least probable that it has a close connection with that destructive murrain, which, in many instances, does not appear alone, but accompanied by other diseases. The mold may be traced spreading round the edges of the brown spots on the leaves, and soon destroying the tissue on which it was developed." (Art. *Botrytis* in Morton's *Cyclopædia of Agriculture.*) The destruction results not only from the fungus feeding upon the juices of the plant, but from its obstructing the elaboration of the sap and all the processes which in a healthy state take place at the surface of the leaf.—The whole subject of the propagation of fungi of this kind is involved in great obscurity. They are indeed seen to produce seeds (or spores) in great abundance, but the doubtful question is, how these reach the place where they are to grow, whether from the surface of the leaf, to which it is objected that the stomata are too small to admit them, or, as Mr. Berkeley thinks, from within the plant. See POTATO DISEASE.

BOTTA, CARLO GIUSEPPE GUGLIELMO, an Italian poet and historian, b. in 1766 at S. Giorgio del Canavese, in Piedmont. He studied medicine in Turin. In 1794, he became a physician to the French army, and in 1799, he, Carlo Aurelio de Bossi, and Carlo Giulio, were appointed the provisional government of Piedmont. They were known as *Il triumvirato de tre' Carli.* After the battle of Marengo, he became a member of the Piedmontese Consulta. In the *Corps Legislatif*, he gave offense to Napoleon, by designating his government as despotic. In 1830, he was allowed to return to his native town, and was pensioned by Charles Albert. He died in Paris, 10th Aug., 1837. Of his works of earlier date, the following may be mentioned, in which his admirable historic style is gradually developed: *Description de l'Ile de Corfu* (2 vols., Par. 1799); *Souvenirs d'un Voyage en Dalmatie* (Tur. 1802); *Précis Historique de la Maison de Savoie* (Par. 1803); *Histoire de l'Amérique* (Par. 1809). His epic poem in twelve books, *Il Camillo o Vejo Conquistata* (Par. 1816), was also favorably received. But his most important works are his *Storia d'Italia dal* 1789 *al* 1814 (Par. 1824), which has gone through many editions, and for which he received the quinquennial prize of 1000 Tuscan dollars, founded by the grand duke Ferdinand II. in 1814, in the *Accademia della Crusca* at Florence; his *Histoire des Peuples d'Italie* (3 vols., Par. 1825), in which he denies to the Christian religion and to philosophy the credit of having civilized Europe, and ascribes it to the restoration of learning; and the *Storia d'Italia dal* 1490 *al* 1814 (20 vols., Par. 1832), which consists of Guicciardini's work (1490–1534), Botta's continuation of it (1535–1789), and the above-mentioned *Storia d'Italia.*

BOTTA, PAUL EMILE, a distinguished French archæologist and traveler, the son of the preceding, was b. in 1805. While yet young, he undertook a voyage round the world, and remained long about the western coasts of America, where he zealously collected treasures of natural history. In the year 1830 he went to Egypt, where he entered into the service of Mehemet Ali as a physician, and in this capacity accompanied the Egyptian expedition to Sennaar. Here he formed a very considerable zoological collection, with which he returned to Cairo in 1833. The French government now appointed him consul in Alexandria, from which he undertook a journey to Arabia, the results of which he gave to the world in a work entitled *Relation d'un Voyage dans l'Yémen, entrepris* 1837, *pour le Muséum d'Histoire Naturelle de Paris* (Par. 1844). From Alexandria the government sent him as consular agent to Mosul, and at this place, at the instigation of the German orientalist Julius Mohl, he commenced a series of discoveries which form an epoch in archæological science. Early in the spring of 1843, B. began his diggings in the heaps of ruins near the Tigris, for monuments of Assyrian antiquity, and the *Journal Asiatique* soon contained accounts of the success with which his enterprise and perseverance were rewarded, and also disquisi-

tions on the extremely difficult subject of the cuneiform writing of the Assyrians, which afterwards appeared as a separate publication under the title, *Memoires de l'Ecriture Cunéiforme Assyrienne* (Par. 1848). The French government took up the matter warmly; a practiced draughtsman was sent out for the purpose of making sketches upon the spot of the sculptures on alabaster, so apt to fall to pieces; and a commission of learned men was appointed, for the purpose of conducting the publication of a magnificent archæological work, which shortly afterwards appeared under the special superintendence of B. himself, with the title, *Monument de Ninive, découvert et décrit par Botta, mesuré et dessiné par Flandin* (Par. 1849–50). In 1848, he published the *Inscriptions découvertes à Khorsabad*. In 1846, B. was appointed consul at Jerusalem, and in 1857 at Tripoli. He returned to France in 1868, and died at Achères, near Poissy, in 1870. Although in abundance of results B. was far exceeded by Layard (q.v.), yet he certainly deserves the praise of having laid the foundation of Assyrian archæology. See ASSYRIA.

BOTTA, VINCENZO, PH.D., b. 1818, in Piedmont; professor of philosophy in Turin, and in 1849 a member of the Sardinian parliament. He came to the United States several years ago, and became professor of the Italian language and literature in New York university. He is the author of *The American Question, Discourse on the Life of Count Cavour, Dante as a Philosopher, Patriot, and Statesman*, etc.

BOTTARI, GIOVANNI, a learned Italian prelate, was b. at Florence, Jan., 15, 1689. He studied ancient literature and eloquence under Biscioni, and subsequently applied himself to mathematics, philosophy, and theology. He soon obtained a great reputation for the delicacy and purity of his style. The Della Crusca academy intrusted him with the care of a new impression of its famous dictionary. This extensive work occupied B. and his collaborateurs several years, and proved of extreme service to the Italian language. In 1730, he went to Rome, where he was made professor of ecclesiastical history and of controversy in the college of La Sapienza. He also took part in the labors of the geometer Manfredi, when the latter was engaged in determining the level of the Tiber. Clement XII. appointed him librarian of the Vatican, and Benedict XIV. canon of Santa Maria Transteverine. He died at Rome, 3d June, 1775. The works of which B. was either the author or editor are very numerous; the principal are his edition of *Virgil* from the Vatican MS.; his elaborate treatises on the catacombs of Rome and on the Vatican; his *Del Museo Capitolino;* and his dissertations on Dante, Boccaccio, and Livy.

BÖTTGER, or BÖTTCHER, or BÖTTIGER, JOH. FRIEDR., by whom the art of porcelain manufacture was very much improved in Germany in the beginning of last century, was b. in 1681 or 1682 at Schleiz, in the territory of Reuss. His father was master of the mint at Magdeburg and at Schleiz. He was apprenticed to an apothecary in Berlin, but became an enthusiast in the search for the philosopher's stone, for which he neglected everything else, thereby involving himself in many difficulties, and incurring the displeasure of the authorities, so that he was obliged to flee from Berlin, to escape the risk of being punished as an adept. He found protectors and patrons at the court of Saxony, and received large sums to enable him to prosecute his experiments in alchemy. Disappointment ensuing, as he did not succeed in making gold, he was called upon to reveal his secret in writing, and handed in a manuscript full of mystical nonsense, but in which he expressed himself with the air of one completely master of his subject. The king, however, was dissatisfied with this production, of which he appreciated the worthlessness, and readily consented to a request of the count of Tschirnhausen, who desired to avail himself of the skill which he believed B. really to possess, for experiments upon clays, with a view to the manufacture of porcelain. B. was compelled, accordingly, to enter upon these experiments, of which the celebrated Meissen (q.v.) porcelain was the result. See POTTERY. But as a security against the revelation of the art of making it, he and his assistants were treated as prisoners, and when Saxony was invaded by Charles XII. of Sweden in 1706, they were secretly removed from Dresden to Königstein. His success was, however, rewarded with large presents, which he soon squandered. He died on 13th Mar., 1719.

BOTTICELLI, SANDRO (for ALESSANDRO), b. 1447; a Florentine painter, called one of the most original and fascinating of that school. He was the son of Mariano Filipepi, but took the name B. from a goldsmith with whom he served when a boy. From the goldsmith he went to study under the painter Lippo Lippi, after whose death he worked independently. All of B.'s creations are colored with an expression of eager and wistful melancholy, of which it is hard to penetrate the sense, and impossible to escape the spell. He was an artist of immense invention and great industry. In color B. was rich and fanciful, often using gold to enrich the lights on hair, tissues, and foliage with exquisite effect, and no one ever painted flowers with more inspired affection. The date of his death is unknown.

BÖTTIGER, KARL AUGUST, one of the most erudite and thoughtful archæologists of Germany, was b. 8th June, 1760, at Reichenbach, in Saxony. He studied at Leipsic. In 1791, chiefly through the influence of Herder, he was appointed director of the gymnasium, and consistorial councilor at Weimar. Here he enjoyed the stimulating society of

Schiller, Herder, Wieland, Goethe, and others. His literary activity at this period was prodigious. He edited several journals, and wrote multitudes of reviews, biographical notices, etc., for the *Allgemeine Zeitung*. In 1804, B. was called to Dresden, where he began to deliver lectures on special branches of classical antiquities and art. The result of these was: *Discourses on Archæology* (Dresden, 1807); *On Museums and Collections of Antiques* (Leip., 1808); *The Aldobrandinian Marriage Festival* (a mythico-allegorical interpretation of a picture discovered by a member of the Florentine family of Aldobrandini, representing a Roman marriage,—Dresden, 1810); *Thoughts on the Archæology of Painting* (Dresden, 1811); and the *Mythology of Art* (Dresden, 1811). In 1814, appeared his *Lectures on the Dresden Gallery of Antiques* (Dresden); in 1821–25, his *Amalthea*, or *Museum of Mythological Art*, etc. (Leip.); and in 1826, his *Thoughts on Mythological Art* (Dresden and Leipsic). In 1832, B. was elected a member of the French institute. He died 17th Nov., 1835. His works, both in Latin and German, have been collected and edited by Sillig.

BOTTLE (Fr. *bouteille*, which is the dim. of *botte* or *boute* [allied to Eng. *butt*], a vessel), a vessel generally of a round shape, with a narrow neck, for holding liquids. Bottles are now usually made of glass or earthenware; but the first bottles were made of the skins of animals, mostly goats—of this kind were the bottles spoken of in Scripture. Skin bottles are still used in southern Europe for the transport of wine, and by tribes of Africa and Asia for carrying water. The ancient Egyptians made bottles of most elegant form and exquisite workmanship of alabaster, stone, gold, ivory, and other substances. The Italian peasants carry, slung round their necks, bottles made of the rind of the gourd, which, when dry, is as hard as wood. Bottles made of glass will be treated of under Glass.

BOTTLE CHART, Bottle Papers. A bottle chart purports to show the track of sealed bottles thrown from ships into the sea. It is a well-known practice to throw sealed bottles containing some intelligence into the sea during long voyages, in the hope that these fragile messengers may be picked up, and their intelligence reach its proper destination. The frequency of these instances at length led to the inference, that by such means the determination of currents might be illustrated. Lieut. Becher, an English naval officer, has the merit of having constructed, in 1843, a chart of bottle-voyages in the Atlantic, his facts being drawn from the numerous cases that had occurred. The time which elapses between the launching of the bottle from the ship and the finding it on shore, or picking up by some other ship, has varied from a few days to sixteen years; while the straight-line distance between the two points has varied from a few m. to 5000 miles. Of the actual length of the curved line followed by the bottle, little or nothing is known; but some are believed to have exceeded 8000 miles. The B. C. has been re-edited and re-engraved from time to time, and published in the *Nautical Magazine;* it is marked by several hundred straight lines, each drawn from the lat. and long. of immersion to the lat. and long. of the finding.

BOTTLE-GLASS. See Glass.

BOTTLE-GOURD, *Lagenaria*, from Lat. *lagena*, a bottle, a genus of plants of the natural order *cucurbitaceæ* (q.v.), nearly allied to the gourd (q.v.) genus (*cucurbita*), in which it was until recently included. One of the most marked distinctions between them is the very tumid border of the seeds of the bottle-gourds, which have also all the anthers separate, and have white flowers, whilst those of the gourds proper are yellow. The common bottle-gourd, or false calabash (*lagenaria vulgaris*), is a native of India, but is now common almost everywhere in warm climates. It is a climbing musky scented annual, clothed with soft down, having its flowers in clusters, and a large fruit, from 1 to even 6 ft. in length, which is usually shaped like a bottle, an urn, or a club. The fruit has a hard rind, and when the pulp is removed, and the rind dried, it is used in many countries for holding water, and is generally called a *calabash* (q.v.). The bottle-gourd, in its wild state, is very bitter and poisonous, and even in cultivation, some of its varieties exhibit not a little of the bitterness and purgative properties of colocynth (q.v.). Other varieties, however, have a cooling edible pulp. This is most perfectly the case, in general, with those which attain the greatest luxuriance. The bottle-gourd appears to have been introduced into Europe about the close of the 16th c., but it requires for its advantageous cultivation a warmer climate than that of any part of Britain, where, although it succeeds well enough on a hotbed, it is chiefly known as an object of curiosity. It is, however, much cultivated in warmer countries as an esculent, and is an important article of food to the poorer Arabs, who boil it with vinegar, or make a pudding of it in its own rind with rice and meat.

Another species, *L. idololatrica*, is a sacred plant of the Hindus, much employed in their religious ceremonies.

BOTTLEHEAD (synon. *Bottlenose, Bottle-headed Whale, Bottle-nosed Whale*, or *Beaked Whale*), a cetaceous animal occasionally but rarely met with on the British coasts, and on those of the continent of Europe. It was until recently placed in the genus *delphinus* by naturalists, and is still ranked among the *delphinidæ* or dolphin (q.v.) family; but some of its characters appear to make it a connecting-link between them and the *balænidæ*, or true whales. A new genus, *hyperoödon* (the name of which is derived from the Greek, and refers to the peculiarities of the dentition), has been erected for it;

but unfortunately several specific names have been adopted by different authors—as *H. Butzkopf*, *H. bidens*, and *H. Honfloriensis*—to the increase of difficulty and obscurity; whilst it appears that there is only one species to which they equally belong. The B. has the snout produced into a beak, as in the dolphins; the beak is short and strong; the forehead rises suddenly from the beak, and is remarkably elevated, a peculiarity which is owing to large bony crests rising over the bones of the upper jaw. The teeth are only two in number, and are situated in the fore-part of the lower jaw, pointed, but much enveloped by the soft parts, and sometimes completely hidden among them: the palate and upper jaw are furnished with little hard points or tubercles, not one tenth of an inch in height, which, however, have been doubtfully regarded as a kind of false teeth, and by Cuvier as rudimentary vestiges of whalebone. There is a dorsal fin, rather small in proportion to the size of the animal, and placed farther back than in the common dolphin. The blowhole is crescent-shaped, the points of the crescent directed backwards. The skin is smooth and glossy, of a blackish lead color on the back, gradually becoming lighter on the sides, and whitish on the belly. The animal attains a length of about 25 feet.

The B. has occasionally been caught in consequence of its having entered harbors or the mouths of rivers. One was caught above London bridge, and figured and described by Hunter in the *Philosophical Transactions* for 1787. It is impossible that too great attention can be paid to specimens of the rarer cetacea caught or driven ashore on any part of the coast, and it is to be hoped that the obscurity and confusion still so much prevailing in this branch of natural history may soon be removed. Photography seems to afford new facilities for an exact comparison of specimens, of which advantage ought to be taken; and everything capable of being preserved should be so carefully, for the study of naturalists. There is a splendid skeleton of the B. in the museum of the royal college of surgeons, London.

The name BOTTLE-NOSED WHALE has been also given to a species of dolphin (q.v.), *delphinus tursio*, which is occasionally met with on the British coasts.

BOTTLE-NOSE WHALE, or BOTTLEHEAD, *Hyperaodon bidens*, a cetaceous inhabitant of the n. Atlantic, sometimes seen in deep rivers. It is seldom as much as 20 ft. long. The name is sometimes given to a species of dolphin, *delphinus tursis*, inhabiting the same seas.

BOTTLE TREE, *Sterculia rupestris*, a native of Australia, noted for great globular expansion between the ground and the branches; or, where the soil is without rocks, for a trunk in the shape of an ordinary bottle, the limbs appearing to grow from the mouth.

BOTTOM, in naval language, is either the whole ship itself, or that part of it which is under water when laden. Commodities are often said to be imported "in foreign bottoms," or in "British bottoms;" in which cases, the phrase is applied to the whole ship. A "full ship," or a "full B.," denotes such a form given to the lower half of the hull as to allow the stowage of a large amount of merchandise. A "sharp ship," or a "sharp B.," implies a capacity for speed.

The word B. is also applied in an obvious way to the bed of the sea, which is characterized as rocky, stony, sandy, coral, muddy, oozy, etc., bottomed.

BOTTOM HEAT, an artificial temperature in certain soils arising from the fermentation or decomposition of manure, tan bark, leaves, etc., buried for the purpose, and sometimes heated by hot-water pipes. The system is much used in hot-houses and for forcing the growth of tender plants.

BOTTOMRY, BOND OR CONTRACT OF, is a security by which a ship itself is expressly mortgaged and pledged by the owner or master, or *hypothecated* for repairs to the ship, or for money advanced for its outfit, or otherwise with relation to it. It is called a security by *B.*, because the bottom or keel of the ship is figuratively used to express the whole of it. The loan or debt is repayable only in the event of the ship's safe arrival at the port or destination; and in consideration of this risk, the lender or creditor exacts a premium, the amount of which depends on the nature of the adventure. If the ship be totally lost, the lender loses his money; but if she returns safely, he recovers his principal, together with interest at the rate agreed upon. These contracts are not treated as ordinary mortgages, and preferred according to the order of date; but inversely, the latest is preferred to the preceding, because it is presumed that the last loan saved the ship, and in all cases necessity alone is the condition of the contract.

Such, generally, is the law of Great Britain; but the French law appears to be different. By that system, a ship, as movable property, cannot be hypothecated, but remains subject to the debts of the seller until it has made a voyage at sea under the name and at the risk of the new purchaser, unless it has been sold under a decree; and it is a rule that the sale of a ship at sea shall never prejudice the creditors of the seller. See RESPONDENTIA and MERCHANT SHIPPING ACT.

BOTTOMRY (*ante*), a term in maritime law. The act of congress (July 29, 1850) declares bills of sale, mortgages, hypothecations, and conveyances of vessels invalid against persons—other than the grantor or mortgager, his heirs and devisees—not having actual notice thereof, unless recorded in the office of the collector of the customs where such vessel is registered or enrolled, and expressly provides that the lien by bottomry

on any vessel, created during her voyage by loan of money or materials necessary to repair or enable such vessel to prosecute a voyage, shall not lose priority, or be in any way affected by the provision of that act. Seamen have a lien prior to that of the holder of a bottomry bond for their wages in the voyage in which the bottomry was incurred, or in any subsequent voyage; and the owners are also personally liable for seamen's wages. If the holder of the bottomry bond is compelled to satisfy the seamen's lien, he has a right to compensation from the owners, and it has been held that he has a lien upon the proceeds of the ship for his reimbursement.

BOTTS, JOHN MINOR, 1802–69; b. Va.; lawyer and politician, elected to the Virginia legislature in 1833, and several times thereafter; in 1839, chosen to Congress, where, with Henry Clay, he supported the tariff, the distribution of public lands, etc. When president Tyler left the party that elected him, B. left him, although a long-time personal friend. He opposed secession, and was faithful to the union throughout the rebellion. When that ended he became one of Jefferson Davis's bail. He published *The Great Rebellion; its Secret History.*

BOT'ZEN, or BOZEN (Ital. BOLZANO), an important trading t. of the Austrian Tyrol, about 32 m. n.n.e. of Trent. B. is a well-built town, with good streets and arcades; and streams of pure water are conducted through the principal thoroughfares, in little canals. It is protected from the inundations of a mountain-torrent in the vicinity by a strong wall about 2 m. in length. Its situation on the Brenner railway and at the junction of the roads from Germany, Italy, and Switzerland, makes B. an important entrepôt. It has manufactures of silk, linen, hosiery, leather, etc.; and four extensive annual fairs. Wine and fruits in abundance are produced in the environs. Pop. '69, 9357.

BOUCHAIN, a fortified t. of France, in the department of Nord, 12 m. s.e. of Douai, intersected by the Scheldt, and possessing the means of laying the adjacent country under water in the event of an attack. It was taken by the duke of Marlborough in 1711, and recaptured by the French in the following year, to whom it was finally ceded by the treaty of Utrecht. Pop. '72, 1039, who are chiefly engaged in extracting sugar from beet-root, and in refining salt.

BOUCHER, FRANCIS, a French painter of great note in his day, was b. at Paris in 1704, and after studying there under Francis le Moine, he went to Rome to prosecute his art. After a short residence there, he returned to Paris, and on the death of Vanloo, was appointed principal painter to Louis XV. B. was an artist of much ability, and equally facile in the production of figure or landscape pictures—a facility, however, which was very fatal to the claims his genius might otherwise have had on posterity. In many of his paintings, picturesque effect is the only thing sought, no matter at what cost to truth. He has been called the Anacreon of painting, on account of the amorous character of many of his works: mythological and pastoral subjects were also great favorites with him. At his death in 1770, he was director of the French academy.

BOUCHER, JONATHAN, 1738–1804; an English clergyman who came to Virginia as a private teacher, afterwards took orders and was a rector in Maryland just before the revolution; his loyalism induced him to return to England, where he became vicar of Epsom. He published *A View of the Causes and Consequences of the American Revolution,* dedicated to Washington; and a *Glossary of Archaic and Provincial Words.*

BOUCHER, PIERRE, (SIEUR DE BOUCHERVILLE), b. France, 1622, d. Canada, 1717; a pioneer and Huron interpreter who came to America in 1635 and was engaged in the wars with the Iroquois. He was sent by the colony as deputy to France in 1661, about which time he published a *History of New France.* He was ennobled and appointed governor of Three Rivers. He was a brave and good man, the ancestor of some of the most important families in Canada. Shortly before his death he addressed to his children *The Adieus of Grandfather Boucher.*

BOUCHER DE CREVECŒUR PERTHES, JACQUES, 1788–1868; a French archæologist and writer who was employed by Napoleon on several diplomatic errands. He was the author of a comedy, several tragedies, articles in favor of free trade, etc., and was president of the society of emulation at Abbeville. He collected Roman and Celtic antiquities, presenting them to the government, and gained much celebrity by archæological discoveries and by his work *On the Creation.* He wrote also on primitive industries and arts, on antediluvian antiquities and stone implements, besides various works of the imagination.

BOUCHES-DU-RHONE, a department in the s.e. of France, formerly a part of Provence, is situated at the mouth of the Rhone, in lat. 43° 10′ to 43° 56′ n., and long. 4° 13′ to 5° 40′ east. It has an area of 1970 sq.m., and a pop., in '76, of 556,379. It is divided into three arrondissements—Marseilles, Aix, and Arles—which are subdivided into 27 cantons and 108 communes. Through the northern and eastern districts, the maritime Alps, which send out some calcareous ridges southward, slope gently down to the basin of the Rhone. Towards the sea shore, there are several plains of considerable extent. About one-half of the department is under cultivation; heaths, wood, wastes, and water occupy the other half. The Rhone—which between Arles and the sea separates into several branches, forming a delta, called *Ile de la Camargue*—and its affluent, the Durance, are the principal rivers. The department is intersected by several canals of importance, and

the aqueduct to convey the water from the Durance to Marseilles is one of the most extensive works of the kind in existence, being no less than 51 m. long, including 15 m. of tunneling. The *Ile de la Camargue* produces corn and rice, and affords pasture for large numbers of sheep and cattle. The vine, olive, and mulberry also thrive here, and timber is plentiful. The soil in some parts, however, is strongly impregnated with salt. The great plain of Crau, which extends along the eastern branch of the Rhone, is stony and arid, except in a few spots, where the vine and olive are successfully cultivated. Besides the Etang de Berre (q.v.), there are numerous salt-lakes, communicating with the sea by natural or artificial channels. Marble, limestone, and gypsum are found in the Bouches-du-Rhone. Leather, hats, perfumes, soap, olive-oil, vinegar, and chemical products are manufactured; there are extensive brandy-distilleries, sugar-refineries, and salt-works, and the produce of wine is large. B. has an active commerce with the Levant, Africa, Spain, and the West Indies.

BOUCICAULT, Dion, dramatic author and actor, was b. at Dublin on the 26th of Dec., 1822. He was brought up under the guardianship of Dr. Dionysius Lardner, the well-known popular writer on science, and was educated at University college, London. He produced his first dramatic work very early—before he was 19 years old. It was signally successful, and its success determined his career. This was *London Assurance.* It was first performed at Covent Garden theater in Mar., 1841: and it has ever since remained a favorite with play-goers, both throughout Great Britain and in America. Much of the success it had in London must be ascribed to the admirable acting of Mr. Charles Mathews; but it had merits of its own sufficient to secure to it the favorable verdict of the public. The plot was slight, but ingenious; it abounded in comic situations; the dialogue was brisk and sprightly; there was no lack of wit, and there was perhaps somewhat too much of those flippancies and pleasant impertinences which average theater-goers prefer to wit. Once embarked in the career of a play-writer, B. produced piece after piece in rapid succession, and greatly increased the reputation which his first attempt had brought him. *Old Heads and Young Hearts, Love in a Maze, Used Up, Louis XI.,* and *The Corsican Brothers* were among the most popular of his early works. Several of these are still stock pieces at our theaters; and to play-goers, the mere enumeration of their names will show that B. distinguished himself equally in comedy, farce, and melodrama. When he went upon the stage, as he soon did, he added a high reputation as an actor to the reputation he had previously gained as an author. From 1853 till 1860 he was in America, where his popularity was scarcely less than it had been in England. On his return to England in 1860, he produced at the Adelphi theater, a play, *The Colleen Bawn,* which proved among the most successful of modern times, and which, if not the first of a new school, has at least supplied a new descriptive name to our dramatic literature. *The Colleen Bawn* was, happily enough, described as a "sensation drama;" its interest depended largely upon scenery, mainly upon startling incidents and astounding stage-effects. It was not a high kind of work, or fit to stand the tests of a good dramatic piece, as nobody knew better than the author; but it suited the public taste, and the author made a fortune by it. It has been performed at almost every theater in the united kingdom; it had a great run in America too; it was even translated into French, and brought out at the Ambigu theater at Paris. Mr. B. subsequently produced at the Adelphi—of which he was for some time joint-manager with Mr. B. Webster—another "sensation" drama, *The Octoroon,* the popularity of which was only inferior to that of *The Colleen Bawn.* Having quarreled with Mr. Webster, he, in 1862, opened a new theater in London, the Westminster, erected on the site of what had been for generations known as Astley's amphitheater; but this speculation turned out unfortunate, and B. was ruined by it. He afterwards re-established his fortunes by new plays, brought out at the Princess's, the Holborn, and other theaters, in some of which he and his wife—formerly Miss Robertson, a very popular actress—took the leading parts. *The Streets of London, Flying Scud, After Dark,* and the *Shaughraun* have been the most popular of his recent works, all of which are of the "sensation" school, with which, it may be said, he first familiarized the public. He has written upwards of 150 dramatic pieces; and in illustration of the facility with which he has composed works which—all deductions made—are of considerable merit, it may be said that he lately stated to a royal commission that he would undertake to write plays for all the theaters in London. He is undoubtedly capable of writing better works than any he has yet written; but he found the public taste bad, and instead of making thankless attempts at improving it, he has been content to gratify it; and in fact has helped to debauch it. As an actor, B. has always been popular, without attaining to high excellence in his vocation. He wants some natural gifts, without which a man cannot be a great actor; he has an immobile countenance, an indifferent voice, and a too artificial manner. Any success he has had has been gained by the soundness of his judgment and his great cleverness. In 1876 he went to live in New York.

BOUDINOT, Elias, ll.d., 1740–1821; a descendant of the French Huguenots; b. Philadelphia. He practiced law, and was an early advocate of colonial liberty. In 1777, congress made him commissary-general of the prisoners, and in the same year he was chosen a member of congress, becoming president thereof in 1782, and signing the treaty of peace the next year in his official capacity. Washington made him superin-

tendent of the mint in 1796, but he resigned in 1805 and retired from public life. He was a trustee of Princeton college, to which he gave a cabinet of natural history. In 1812, he was a member of the American Board of commissioners for foreign missions, and in 1816 first president of the American Bible society, to both of which he gave large donations. B. was one of the first writers to favor the idea that the American Indians were of Jewish origin, to which end he published *The Star of the West, or an Effort to Discover the Lost Tribes of Israel.* He published the *Age of Revolution, or the Age of Reason an Age of Infidelity*, and other less important works.

BOUDOIR (Fr. *bouder*, to pout—hence a retired corner), a lady's small private apartment, in which she receives only her most intimate friends. Boudoirs became particularly fashionable in France during the reign of Louis XIV., and so continued during the following reign. The example having been set by Madame Pompadour, Madame Dubarri, and other royal mistresses, it became indispensable for every lady of fashion to have her B., which was adorned with the most fantastic luxuriousness.

BOUFARIK, a village of Algeria, in the province of Algiers, and 16 m. s. of Algiers. It is an important military station on the road from Algiers to Blidah and Oran. It has well-frequented markets, and a considerable trade in corn, cotton, olives, oranges, tobacco, raisins, and cattle. Pop. 7650.

BOUFLERS, Louis Français, Duke of, peer and marshal of France, one of the most distinguished generals of his time, was b. in 1644, and was descended from one of the most ancient and noble families of Picardy. He began his military career as a lieut., and rose very rapidly from one rank to another. Under the great Condé, Turenne, Crequi, Luxembourg, and Catinat, he fought with distinction in Germany and the Netherlands. His defenses of Namur in 1695 and of Lilla in 1708, are famous. The siege of the former place, conducted by king William III. of England, cost the allies more than 20,000 men; and although Louis XIV. sent to B. an order written by his own hand for the surrender of the place, yet he did not surrender it until all the means of defense were exhausted. After the defeat of Malplaquet, he led the French army so admirably, that the retreat seemed rather a triumph than the consequence of a lost battle. He was a man of highly honorable and upright character. He died at Fontainebleau in 1711.—His son, Joseph Marie, duke of Boufflers, and also a marshal of France, b. in 1706, d. at Genoa in 1747.

BOUFLERS, Stanislas, Marquis de, commonly styled the chevalier de Boufflers, was b. at Luneville in 1737. He was the son of the marquis Boufflers-Remiencourt, who was capt. of the guard to Stanislas, king of Poland, and his mother was long one of the brightest ornaments of the Polish court. He himself was esteemed one of the most clever and agreeable men of his time. He entered the French military service, and was very soon made governor of Senegal, in which capacity he had the merit of introducing many regulations very useful to the colony. After his return, he devoted himself to the light literature for which the time of Louis XV. was distinguished. He was chosen a member of the national assembly in 1789, in which he displayed great moderation, and made some most judicious proposals; but after the 10th of Aug., 1792, he forsook France. He was hospitably received at the court of Prussia, and received the gift of a large estate in Poland, in order to establish upon it a colony of French exiles. Having returned to France, he again devoted himself, after the year 1800, entirely to literature. In 1804, he entered as an old academician into the institute reórganized by Napoleon. He died 18th Jan., 1815. The monument on his grave bears the following inscription, dictated by himself: *Mes amis, croyez que je dors* (My friends, believe that I sleep). A collection of his works was published after his death (8 vols., Par. 1815). His letters from Switzerland deserve to be particularly mentioned; and from this work an idea may be formed of the amiable character and intellectual liveliness of its author.

BOUGAINVILLE, a bay, island, and strait, so called from the French navigator of the name (q.v.), a contemporary of Cook.—1. *Bay*, in Patagonia, on the n. side of the strait of Magellan, being in lat. 53° 25′ s., and long. 70° 13′ w.—2. *Island*, one of the Solomons, in the w. section of Polynesia, sometimes distinguished from the e. section as Melanesia. It is between lat. 5° 30′ and 7° 2′ s., and in long. 155° e., being mountainous, well wooded, and populous.—3. *Strait*, in the New Hebrides, having Mallicollo to the s.e., and, to the n.w., Espiritu Santo, an islet of 63 m. by 20, which now appropriates the appellation that so long drifted about the ocean in search of a southern continent.

BOUGAINVILLE, Louis Antoine de, one of the most famous navigators of France, was the son of a notary, and was b. at Paris, 11th Nov., 1729, studied there, and attained great proficiency both in languages and science. In 1754, he went as secretary of the French embassy to London. In 1756, he acted as aide-de-camp to the marquis of Montcalm, to whom the defense of Canada was intrusted. At the head of a select detachment he burned an English flotilla; and through his advice and example, a corps of 5000 French in June, 1758, successfully withstood an English army of 24,000 men. In the campaign of 1761 in Germany, he served with distinction. After the peace he entered the naval service, in which he soon signalized himself. After having been obliged to give up a project which he had formed of founding a settlement on the Falkland islands, he under-

took a voyage round the world (15th Dec., 1766, to 16th Mar., 1769) with a frigate and a St. Malo transport, the first voyage round the world which the French ever accomplished. He gave an account of it in his *Description d'un Voyage autour du Monde* (2 vols., Par. 1771–72). Geography and other branches of science were enriched by it with many discoveries. In the North American war, B. commanded several ships of the line, and in 1779 was made *chef d'escadre;* in the following year, he was made a field-marshal in the army. After the outbreak of the revolution, he retired from public service, devoted himself entirely to scientific pursuits, and died 31st Aug , 1811.

BOUGHT AND SOLD NOTES are notes of sale signed by a broker employed to sell goods, and by which the bargain through him is completed. The following is the form of the bought and sold note:

"Sold for A. B., to C. D., 250 firkins butter, at 100*s.* Shipped in the month of July, and payable by bill at two months."

These notes are, in fact, transcripts from books, in which it is the practice of brokers to enter or register their transactions. The bought notes and the sold notes are respectively delivered to the principal parties; and as they contain the essential parts of the bargain, they will suffice, in the absence of a corresponding entry in the broker's books; but if they describe the particulars differently or incorrectly, as one species of goods for another, or erroneously state the terms, no contract arises, and a variation of this nature cannot be corrected by a reference to the broker's book.

In Scotland, there is no necessity for any such signed note, but the contract may be proved by any kind of evidence, verbal (see PAROLE EVIDENCE) as well as written, the only exceptions to this general rule being those contained in acts of parliament relative to ships, literary property, patents, and goods bonded in the queen's warehouses. See BROKER, SALE OF GOODS.

BOUGHTON, GEORGE H., b. England, 1836; came to the United States when three years old, and spent his early years in Albany. He had a talent for drawing, and after finding favor for a few paintings, he went to London for study and practice. Returning to New York, he soon became known as a rising artist, especially by "Winter Twilight," and the "Lake of the Dismal Swamp." To qualify in genre painting, he studied two years in Paris, and in 1861 settled in London, where he makes his headquarters. Besides the pieces mentioned, he has presented "Passing into Shade," "Coming from Church," "Cold Without," "Morning Prayer," "The Scarlet Letter," "The Idyl of the Birds," "The Return of the May-flower," "Puritans Going to Church," "Clarissa Harlowe," etc. "The Idyl of the Birds" is generally considered his best achievement.

BOUGIE, or BOUGIAH, a fortified seaport in the province of Constantine, Algeria; a town of great antiquity, supposed to have been founded by the Carthaginians. Genseric built walls around it and made it for some time his capital. In the 10th c. it was the greatest commercial city of the n. African coast; and in the 12th and 13th c. Italian merchants had their own warehouses and churches there. In the 15th c. it was a haunt of pirates; the Spaniards took possession in the beginning of the 16th c., and the Turks dispossessed the Spaniards in 1555. Now it has a French church, hospital, barracks, magazine, and a fort; and trade in oil, wine, grain, wax, and oranges. Pop. '72, 2820.

BOUGIES are rods of metal or other substances, used for distending contracted mucous canals, as the gullet, bowels, or urethra. See STRICTURE. For the urethra, they are frequently of German silver, or pewter, and vary from .125 to .25 in. in diameter. Still larger sizes are used by many surgeons. The following directions for making common non-metallic B. are taken from South's translation of Chelin's *Surgery:* "A piece of fine linen, which has been already used, 9 in. long, and ¾ in. in width, according to the thickness of the bougie to be made, is to be dipped into melting plaster, and, when a little cooled, spread flat and even with a spatula; it is then to be rolled together between the fingers, and afterwards between two plates of marble, till it is quite firm and smooth. The bougie must be equally thick throughout its whole length to about 1 in. from its point. Bougies are also made by dipping cotton threads into melted wax till they have acquired sufficient size, after which they are rolled between marble plates. Bougies are also made of a material termed 'gum elastic;' and for very narrow strictures, catgut is often used."

BOUGUER, PIERRE, one of the most eminent French mathematicians and natural philosophers of his time, was born at Croisic, in Bretagne, 16th Feb., 1698, and studied in the Jesuit college at Vannes. In 1713, he succeeded his father as professor of hydrography in Croisic, from which he was removed to a similar office at Havre in 1730. In 1729, he published his *Essai d'Optique sur la Gradation de la Lumière.* His researches on other subjects of natural philosophy and astronomy continued to add to his fame; and in 1731, he was made associate geometer of the Academy of Sciences, and promoted to the office of pensioned astronomer in 1735. In that year, also, he was chosen to proceed, along with Godin and De la Condamine, to South America, in order to the measurement of a degree of the meridian at the equator. B. and his companions had to contend with many difficulties, and were more than seven years away from home, during which time B. made valuable observations on the length of the seconds' pendulum at great elevations, the deviation of the plumb-line from a vertical position through the

attraction of a neighboring mountain, the limit of perpetual snow, the obliquity of the ecliptic, etc. He published an account of his labors and those of his colleagues in a magnificent work, entitled *La Figure de la Terre déterminée par MM. Bouguer et De la Condamine* (Par. 1749), which, however, involved him in an unpleasant controversy with de la Condamine concerning their respective shares of merit in the researches in which they had been jointly engaged. B.'s investigations concerning the intensity of light laid the foundation of photometry; and their results, which had been partly exhibited in the optical work already noticed, were more fully embodied in his *Traité d'Optique sur la Gradation de la Lumière*, which was edited after his death by Lacaille (Par. 1760). He invented the heliometer in 1748, which has of late been brought to greater perfection by Fraunhofer. He also published an excellent work on navigation (Par. 1753). He died in 1758.

BOUGUEREAU, GUILLAUME ADOLPHE, b. 1825; a French painter; studied at Paris. He made the mural paintings in the St. Louis chapel of the church of St. Clothilde, and those in the church of St. Augustine. One of his best known efforts is the "Triumph of Venus," which has been widely distributed in lithographs and engravings.

BOUHOURS, DOMINIQUE; a French critic, 1628–1702. He was a Jesuit, and preceptor to the sons of the duke of Longueville, and his first book was a life of the duke. At a later period he had charge of the education of the sons of Colbert, the great minister. Among his works are *Les Entretiens d'Artiste et d'Eugène*, many times reprinted; *La Maniere de bien penser sur les Ouvrages d'Esprit, Remarks and Doubts upon the French Language, Life of St. Ignatius, Art of Pleasing in Conversation, Life of St. Francis Xavier, Pensées Ingénieuses des Anciens et des Modernes.*

BOUILLE, FRANÇOIS CLAUDE AMOUR, Marquis de, a distinguished French gen., was b. in 1739, at the castle of Clusel, in Auvergne, entered the army at the age of 14, and served with distinction in Germany during the seven years' war. In 1768, he was appointed governor of the island of Guadaloupe, and on the seeming approach of war with Britain, he was made governor-general of Martinique and St. Lucia, and commander-in-chief of all the French forces in the West Indies. When th war really broke out in 1778, he took the island of Dominica from the British, the whole garrison falling into his hands. In conjunction with admiral De Grasse, he took Tobago in 1781; and after De Grasse's departure, the British islands of St. Eustatius, Saba, and St. Martin. The humanity and generosity which he displayed were equal to his valor and skill. In 1782, B. captured the islands of St. Christopher's and Nevis. For this he was rewarded with the rank of lieut.-gen. In 1784, he visited England, and was received with extraordinary respect. Louis XVI. nominated him a member of the assembly of notables in 1787–88; in 1790, he was made commander-in-chief of the army of the Meuse, the Saar, and the Moselle. His decision of character prevented the dissolution of the army and the outbreak of civil war; he also quelled the insurrection of the garrison of Metz and of the three regiments at Nancy. For this he received the thanks of the national assembly and of the king. For his share in the attempted escape of Louis XVI. he had to flee from France. He repaired to Coblenz to the king's brothers, and in 1791 attended the conference at Pilnitz. In the same year he entered into the service of Gustavus III. of Sweden, and after the assassination of that monarch, he served in the corps of the prince of Condé. He rejected a proposal which the French princes made to him in 1793, that he should take the chief command in La Vendée; and went to England, where his advice in West Indian affairs was useful to the government, and where he wrote his *Mémoires sur la Révolution Française*—a truthful and useful work, throwing much light on the transactions of that time. He died in London in 1800.

BOUILLET, MARIE NICOLAS, 1798–1864; French metaphysician and for nearly a quarter of a century professor of ethics and metaphysics in various institutions. He was councilor in the university, inspector in the academy, and inspector-general of public instruction; editor of the philosophical writings of Seneca, Cicero, and Bacon, and the first translator into French of the *Enneads* of Plotinus. Much of his time was devoted to important contributions to cyclopædias, and the editing of some of the best of those in the French language.

BOUILLON, a duchy, originally German, in the Belgian part of the grand duchy of Luxemburg, consisting of a woody and hilly district in the Ardennes, about 157 sq. m. in extent, and with a pop. of 21,000. This duchy was the possession of the famous crusader, Godfrey (q.v.) of Bouillon, who, in order to raise money for his crusade, pledged it, in 1095, to the bishop of Liege. It was conquered by France in the war of 1672, and bestowed by Louis XIV., in 1678, upon his grand chamberlain, Latour d'Auvergne. By the peace of 1814, the greater part of it was included in the grand duchy of Luxemburg; and the sovereignty of it passed to the king of the Netherlands, who, in 1821, purchased the proprietary rights from the heir. By the revolution of 1830, B., along with Luxemburg, was separated from the Netherlands, and in 1837 united to Belgium.—The principal town is Bouillon, situated between steep hills on the Semoy, with a strong castle on a rock formerly the residence of the dukes of Bouillon. Pop 4000.

BOUILLON, FREDERIC MAURICE DE LA TOUR D'AUVERGNE, Duc de, son of Henri; 1605–52; brought up a Calvinist. He was in the French military service, but by reason of aversion to Richelieu he went over to the Spaniards. At a later period he became reconciled to Richelieu, and was made lieut.gen.; only a year afterwards he was arrested as one of the Cinq-Mars conspirators, and was in danger of execution, but his wife had possession of Sedan and threatened to surrender the place to the Spaniards unless he should be saved. In Rome, after the death of Louis XIII., he became a Roman Catholic, and had command of the papal forces. In 1649, he returned to France, and joined in the civil war against cardinal Mazarin.

BOUILLON, GODFREY. See GODFREY OF BOUILLON.

BOUILLON, HENRI DE LA TOUR D'AUVERGNE, Duc de, marshal of France; 1555-1623; at first known as viscount of Turenne. He was a convert to Calvinism and a partisan of Henry of Navarre, who, when king, gave him the hand and estate of Charlotte de la Marck, the heiress of the duchy of Bouillon. On the night in which he was to be married, he suddenly left his prospective bride and stormed the fortress of Stenay, then held by the army of Lorraine. He was afterwards complicated in the Biron conspiracy, and took refuge in Geneva. During the Medici regency he was alternately for and against the queen, but amidst his warlike occupations he established a college and library at Sedan. His second wife, a daughter of William prince of Orange, left him two sons, the younger of whom was the celebrated marshal Turenne.

BOUILLY, JEAN NICOLAS, one of the most prolific of French dramatic authors, was b. at Boudray, near Tours, in 1763, and at first studied law, but afterwards devoted himself to belles-lettres. At the commencement of the revolution, he attached himself to Mirabeau and Barnave, and in 1790 produced a drama called *Pierre le Grand* (Peter the great), in which he displayed very revolutionary sentiments. He afterwards filled important public offices in Tours during times of the most dangerous excitement, and conducted himself with great prudence and moderation. He took an active part in the introduction of the system of elementary schools in France. The greater number of his dramatic works were produced in the first decade of the 19th century. Many of them have been translated into other languages. He wrote also tales and other works for young persons, some of which acquired great popularity. He died at Paris, 24th April, 1842.

BOULAC, or BOOLAK, the name of the port of Cairo, is situated on the Nile, about one mile distant from that city, and is supposed to be the site of the ancient Litopolis. It is a crowded town, extremely dirty, with very narrow and irregular unpaved streets. It contains the custom-house and warehouses of Cairo, factories for spinning, weaving, and printing cotton, a paper-mill, some good baths, and a weekly newspaper. Pop. about 14,000.

BOULAINVILLIERS, HENRY, Count, an eminent French author, descended from an ancient family in Picardy, was b. 11th Oct., 1658, at St. Saire, in Normandy. After studying at the college of Juilly, he embraced the military profession, but afterwards resigned it, and devoted himself to the investigation of the genealogy of the ancient families of France. He regarded the feudal system as the most perfect creation of human genius and wisdom, and his writings are pervaded by the most extreme aristocratic sentiments. They were only circulated in manuscript during his life, and first published after his death, which took place on 23d Jan., 1722. The most valuable of them are his *Histoire de l'Ancien Gouvernement de France* (3 vols., Hague, 1727), his *Histoire de la Pairie de France et du Parlement de Paris* (2 vols., Lond. 1753), and his *Abrégé Chronologique de l'Histoire de France* (3 vols., Hague, 1733). His philosophical writings have long ceased to have any interest, and the prejudices which appear in his historic works may afford amusement to his readers; but he deserves to be remembered as one of the first laborious investigators of the facts of history.

BOULAY DE LA MEURTHE, ANTOINE JACQUES CLAUDE JOSEPH, Count, a statesman of the French empire, was b. in 1761 at Chaumousey, a village in the Vosges. He espoused the cause of the revolution, but held moderate principles. In 1797, he was elected to the council of five hundred, in which he became the declared opponent both of Jacobinism and of the despotism of the directory. He supported the *coup d'état* of the 18th Brumaire. Under the empire, he accepted the post of president of the legislative section of the council of state, in which capacity he had an important part in the preparation of the *Code Civil*. He afterwards labored with extraordinary zeal and energy in the administration of the national domains, which he regarded as affording the basis for a regeneration of France. He adhered to the cause of Napoleon with remarkable fidelity. After the second restoration, he was conveyed by the Russians into Germany. He received permission to return to France in 1819, and lived in complete retirement till his death, which took place at Paris, 2d Feb., 1840. Napoleon had elevated him to the rank of a count of the empire. In 1799, he published an *Essay on the Causes which led to the Establishment of the Commonwealth in England in* 1649, a work which had an extraordinary circulation, and did much to prepare men's minds for the revolution of the 18th Brumaire. He prosecuted the same general subject in his political picture of the reigns of Charles II. and James II. (*Tableau Politique*, etc., 2 vols.,

Brussels, 1818). He wrote also Bourrienne and his errors, voluntary and involuntary (*Bourrienne et ses Erreurs*, etc., 2 vols., Par. 1830), a work not without value in reference to the history of Napoleon.

His son, HENRY BOULAY DE LA MEURTHE, was b. at Paris in 1797. He took an active part in the revolution of 1830, but became an opponent also of the government of Louis Philippe. He devoted great attention to questions of social economy, contributing much to promote the establishment of houses of refuge (*salles d'asile*), the extension of elementary education, and many improvements in the condition of the laboring classes. In the national assembly of 1848, he associated himself with the moderate republicans, and in Jan., 1849, was elected vice-president of the republic. Nevertheless, he tacitly acquiesced in the *coup d'état* of Dec., 1851, and became a member of the imperial senate. He d. at Paris, 24th Nov., 1858.

BOULDER, a co. in n. Colorado, e. of the Medicine Bow mountains; intersected by the Colorado Central railroad, and on the Denver and Boulder branch of the Kansas Pacific; 600 sq.m.; pop. '70, 1939; in '80, 9,746, watered by streams running into the South Platte; productions agricultural; besides gold, silver, and coal. Co. seat, Boulder, or Boulder City.

BOULDER, a city in Boulder co., Col., on the Colorado Central, and a branch of the Kansas Pacific railroads, near the e. foot of the Rocky mountains, 25 m. n.w. of Denver; pop. '80, 3176. There are gold and lignite mines near by. The city is the seat of the state university. There are three churches and two weekly papers.

BOULDER-CLAY, DILU'VIUM, DRIFT, or TILL, is a post-pliocene bed of a remarkable character, and as yet somewhat mysterious history. It usually occurs as the lowest or first of that group of beds which geologists recognize as the post-tertiary, post-pliocene, pleistocene, or superficial formation. The only exception is when a bed of sand intervenes—as is rarely the case—over the surface of the subjacent rocks. It consists of a compact clay, blue or red, according to the prevalent character of the subjacent rocks, having boulders diffused throughout its mass, and with here and there thin lenticular beds of gravel and sand interspersed. In some places in Scotland it is not less than 70 ft. thick. In America, it extends to about the 38th parallel; in Britain, it terminates a little to the n. of London. The boulders, which are the most striking feature of this bed, differ in size from a small pebble to masses many tons in weight. They are portions of rocks of all ages, more or less worn. The older rocks, when from a distance, are rounded, while those that have been broken from rocks in the district are more angular. These masses are scattered without order in the clay, the heaviest blocks occurring frequently in the upper portion of the bed. Nor is there any indication of their having sunk in the clay from gravity—the clay seems to have been so viscid when the materials assumed their present position, as to have successfully resisted the immense pressure of these enormous blocks. The boulders have not that rounded appearance produced by the action of water in a river-course or on the shore between high and low water marks. They have a greater or less number of *rubbed faces*, produced evidently by being forced, while held in one position, over the solid rocks beneath. The rubbed and scratched surfaces exhibited on these rocks, when the superincumbent clay is removed, plainly testify to their origin. Several interesting examples of such rubbed surfaces exist in the neighborhood of Edinburgh. They have been carefully examined and described by Fleming, Chambers, Milne-Home, and other local geologists. A careful observer can determine from the scratchings the direction of the current which bore with it the rubbing boulders. In the district to which we have alluded, these indicate a current from the west. The general direction, however, in America, in Britain, and in Scandinavia, seems to have been from the poles towards the warmer regions of the earth.

The B. contains no fossils strictly its own. Organisms exist in the boulders obtained from the older fossiliferous rocks; but no indications have hitherto been observed of a fauna or flora belonging to the period of the deposition of this bed. In the brick clays and gravels overlying it in Scotland, there are shells of arctic character.

The origin and structure of this remarkable bed have been a puzzle to geologists. That it was produced by the Noachian deluge, as was universally believed not many years ago, finds now no supporters. The present approved explanation assigns it as the product of a glacial ocean, in which the materials were borne violently along, pressing hard upon the sea-bottom, so as to wear and scratch it. But, while there is little room to doubt that such was the general fact, it remains to be shown how a merely ice-charged ocean could carry along such vast masses of clay and blocks allowing them all the time to press so hard upon the sea-bottom as to mold its whole figure—for such appears to have been its work.

BOULDERS, ERRATIC, are large masses of rock found at a distance from the formations to which they belong. The term is generally applied when they are found lying detached on the surface; in which case they may either have been washed out of the boulder-clay (q.v.), or have been carried separately by icebergs, and dropped in their present situations. Large blocks of Scandinavian rocks are scattered over the plains of Denmark, Prussia, and northern Germany. From their magnitude and number, they frequently form a striking feature in the landscape. They abound on the shores of the firth of Forth—a large one, locally known as the "Penny Bap," is the most promi-

rent object on the beach a little to the e. of Leith. The pedestal of the statue of Peter the great, in St. Petersburg, was hewn out of a large erratic boulder, 1500 tons in weight, that lay on a marshy plain near that city.

BOULEVARD, or BOULEVART (Ital. *Boluardo*), identical with Eng. *bulwark* (q.v.), the name given in France to the old fortifications, ramparts, etc., with which towns, or portions of them, were, or still are surrounded. In France and Germany, these ancient works have generally been leveled, the ditches filled up, and the space thus obtained employed for the formation of parks, promenades, and streets lined with trees. These, however, in France, still bear the name of boulevard. The boulevards of Paris are celebrated, and are of great service as open spaces promoting the circulation of air amidst the dense mass of habitations. Some parts of them present a very dazzling spectacle; and as a whole, they afford a striking exhibition of the life and character of the French capital in all the different classes of society. The *Boulevard des Italiens* is particularly known as the rendezvous of the fashionable, and the *Boulevard du Temple* as the place where the small theaters are to be found which are frequented by the common people and the inhabitants of the suburbs, for which reason the expression *Théâter de Boulevard* is often employed to denote a theater for the common people, or one of an inferior kind. The Thames Embankment is essentially a boulevard.

BOULLONGNE, LOUIS DE, 1654–1734; like his father and brother a French painter; member of the academy, rector thereof, and president; first painter to the king, and designer of medals and devices for the academy of inscriptions. The Gobelins tapestry for the king's apartments was made after his designs in imitation of Raphael. B. was also an excellent engraver.

BOULOGNE, a t. of France, in the department of the Seine, on the right bank of the river of that name, about 5 m. w. of Paris, from which it is separated by the Bois de Boulogne. A fine stone bridge of twelve arches crosses the Seine from B. to St. Cloud. Pop. in 1876, 21,556. The Bois de Boulogne is traversed by many walks, through the broadest of which the fashionable world of Paris travels in Easter-week to the abbey of Longchamp. At the entrance of the wood lies Auteuil (q.v.). During the revolution, the trees of the older walks were mostly cut down. But when Napoleon chose St. Cloud, in the immediate neighborhood, for his summer residence, new walks were planted and laid off, and the inclosing walls were restored. This wood, which from ancient times to the present day has been a place of enjoyment and recreation to the Parisians, was again much injured during the siege of 1870–71.

BOULOGNE-SUR-MER, a fortified seaport in the department of Pas-de-Calais, France, situated at the mouth of the Lianne, in the English channel, about 19 m. s.w. of Calais, and 139 n.n.w. of Paris. Lat. 50° 45′ n., long. 1° 36′ e. The town consists of two parts —upper and lower Boulogne. The upper town was, in former times, strongly fortified, but its citadel was demolished in 1690, and its ramparts have been converted into beautiful promenades, with fine views, and from which, in clear weather, the spire of Dover can be seen. The upper town contains the hôtel-de-Ville, and the cathedral, a modern edifice with a conspicuous dome. The lower town, which is more properly the seaport, is newer, finer, more populous, and more lively, inhabited chiefly by merchants, mariners, and fishermen. It contains the barracks, the great hospital, the theater, the museum, and gallery of art. The streets have been much improved by side-pavement, and many new and elegant buildings have been erected. A large wet-dock was completed in 1872. B. has numerous churches and educational institutions; is the seat of various associations; has extensive and excellent salt-water baths; and on account of its fine sands, is much resorted to for sea-bathing. Pop. in 1876, 40,075, actively engaged in the boiling of sugar, in the manufacture of linen and sail-cloth, cordage, etc., and in fishing, the coast being productive in oysters, herring, cod, and mackerel. B. has an active coasting trade, and ranks with Calais as one of the nearest and most frequented places of passage between France and England, steamers plying daily to London, which they reach in from 9 to 10 hours, and twice a day to Folkstone, which they reach in about 2 hours. B. is much resorted to by the English, who form a large section of the population, and for whose accommodation there are numerous hotels and boarding-houses. Paris is reached by railway from B. in 4¼ hours. The harbor of B. is too shallow for large ships of war, which can only reach the wide and safe roads of St. Jean; it was, however, considerably enlarged and improved by Napoleon I., and also more recently—so that at high water large merchant-vessels can, without danger, pass out or in. The long pier forms a fine promenade. B. was anciently called *Gesoriacum*, in the country of the Morini; after the time of Constantine the great, it was called *Bononia*, and after that of the Carlovingians, *Bolonia*. In 1435, B. came into the possession of the duke of Burgundy, and was united with the crown of France by Louis XI. in 1477. B. was besieged by Henry VII. of England in 1492, taken by Henry VIII. in 1544, and restored to the French by Edward VI. in 1550. From this point Napoleon contemplated the invasion of England; and here he encamped 180,000 men and collected 2400 transports, ready at any favorable moment to swoop down on the shores of Britain; but after months' watching, the war with Austria created other employment for them. As a memorial of this great camp, a tall marble column was commenced on the higher grounds; but being incomplete at the restoration of the Bourbons, it was finished and

inaugurated in honor of Louis XVIII. It has since been restored to its original object, and surmounted by a colossal statue of Napoleon. The poets Campbell and Churchill died at B.; and the house, or rather, the house occupying the site of that in which Le Sage, the author of *Gil Blas*, is said to have died, is shown to the visitor. Altogether, B. is to be described as a thriving and agreeable place of residence; and from its accessibility to English tourists, and rapid railway transit to Paris, it has greatly superseded Calais as a place of debarkation.

BOULTER, HUGH, 1671–1742; chaplain to the archbishop of Canterbury; rector of St. Olave's, archdeacon of Surrey; chaplain to George I.; tutor to Frederick, prince of Wales; bishop of Bristol, dean of Christ church (Oxford), archbishop of Armagh, and primate of Ireland, for 19 years chief justice of Ireland. He expended $150,000 in adding to the incomes of poor clergymen and their widows, establishing schools, etc. In the famine of 1740 he fed 2500 persons each day at his individual expense. B.'s *Letters to Several Ministers of State in England Relative to Transactions in Ireland from* 1724 *to* 1738 are a valuable contribution to history.

BOULTON, MATTHEW, a celebrated English mechanician, was b. in 1728 a Birmingham, where his father, who had a steel manufactory, had acquired a considerable fortune. When still very young, he undertook, at his father's death, the business of the manufactory, which he carried on with great energy, and extended, in 1762, by the purchase of a piece of land, then a barren heath, at Soho, near his native town. One of his first inventions was a new mode of inlaying steel. He entered into partnership with James Watt (q.v.), who had obtained a patent for the great improvements in the steam-engine which have immortalized his name, and they established a manufactory of steam-engines in 1769. They jointly contributed also to the improvement of coining machinery, and so to the perfection of the coinage itself. B. died at Soho, 17th Aug., 1809. His long life was devoted to the promotion of the useful arts and of the commercial interests of his native country. He was a man of extremely pleasing conversation, and of a most generous disposition.

BOU MAZA (SI MOHAMMED BEN ABDALLAH), b. 1820; an Algerian Arab leader, who as a dervish in 1845 excited the people of Dahra against the French, and, in alliance with Abd-el-Kader, engaged in several conflicts. St. Arnaud made him a prisoner and sent him to Paris, where he received a pension and was provided with a home. He escaped, Feb. 23, 1848, but was caught and sent as a prisoner to Ham, where he was kept a year and a half. In the eastern war of 1854, he commanded an irregular corps, and the next year was made a col. in the French army.

BOUND, or BOUNDARY, the utmost limits of land by which the same is known and can be described; being in this sense synonymous with *abuttals*, which means the buttings and boundings of lands, e., w., n., and s., with respect to the places by which they are limited and bounded. The *sides* of the land are properly said to be *adjoining*, and the ends *abutting*, to the thing contiguous. For other applications of this term, see the articles that follow.

BOUNDARIES OF BOROUGHS, CITIES, AND TOWNS in England are settled by the 5 and 6 Will. IV. c. 76, ss. 7 and 8, which refers to and adopts, for the purpose of such boundary, the regulations of the 2 and 3 Will. IV. c. 64—amended, however, by the 5 and 6 Will. IV. c. 103. These boundaries are generally the same as the parliamentary limits. The corresponding Scotch law on this subject is contained in the 3 and 4 Will. IV. c. 76, which adopts the limits prescribed in the 2 and 3 Will. IV. c. 65.

By the 7 Geo. IV. c. 64, it is enacted that where, in England, any felony or misdemeanor shall be committed on the boundary or boundaries of two or more counties, or within the distance of 500 yards of any such boundary or boundaries, or shall be begun in one county and completed in another—every such felony and misdemeanor shall be dealt with and tried in any of the counties.

BOUNDARIES OF PARISHES are determined by ancient and immemorial usage, as to which, see PARISH, and see BEATING THE BOUNDS. It may also be observed that by numerous acts of parliament lately passed, for extending church accommodation, and making more effectual provision for the cure of souls, it is generally provided that any part or parts of any parish may be constituted a separate district for spiritual purposes, or parish *quoad sacra*, as it is called in Scotland; and that any parish may also be divided into two or more distinct and separate parishes for all ecclesiastical purposes, though for other purposes the old limits remain. The church building and inclosure acts contain many provisions as to boundaries.

BOUNDARY SURVEY OF IRELAND. This important subject is provided for and regulated by these acts of parliament—the 6 Geo. IV. c. 99, 17 Vict. c. 17, 20 and 21 Vict. c. 45, and the 22 and 23 Vict. c. 8, which are all to be read as one act. The boundary surveyor may alter the names of lands erroneously named in the ordnance map of any county, on the application of the owners of such land, who are to state the ground on which such application is made. And the same surveyor may define the boundaries of parishes divided under certain acts of parliament. The publication in the *Dublin Gazette* of the surveyor's report, referred to in the order of the lord-lieutenant in council, is to be discontinued, on the ground of its being unnecessary and expensive;

and in lieu thereof, any person desirous of seeing the report and ordnance plans, may see them at the council office, in Dublin, at all reasonable hours, without fee or reward. See ORDNANCE SURVEY and SURVEY; and see IRELAND.

BOUND-BAILIFF, in England, is an officer of the sheriff whose duty is to discover and arrest debtors. As the sheriff is responsible for the misconduct of these bailiffs, they are annually bound in an obligation, with sureties, for the due execution of their office, and are, in consequence, called *bound*-bailiffs, a name which Blackstone is at pains to inform us "the common people have corrupted into a much more homely appellation" —*bum-bailiff*. See BAILIFF.

BOUNDING CHARTER, in the Scotch law, is an instrument of title which describes the lands thereby conveyed by their boundaries or limits. It gives right to everything within the bounds, and, on the other hand, it excludes what lies beyond these. If the boundary be the sea or the sea-shore, the right is extended or limited as the sea recedes or advances. If, again, it be a stream or river, the property may be subject to alteration, either extended by *alluvion* (q.v.), or by the gradual and imperceptible variation of the channel; or the stream may cease to be the boundary, in consequence of some violent change. But if the property described in the charter is bounded by walls, the walls, as a general rule, will not be held as included in the grant; and where it is intended that a wall is to be mutual, this must be expressed. When the grant is described both by boundaries and by measurement, the boundaries determine its extent, although containing a larger quantity of ground than the measurement. The lands, however, may be described simply by reference to a plan, and this is a conveyance which makes a valid bounding charter. By statute also a reference to a leading name in a prior deed is a sufficient description. The following articles should be consulted in connection with this subject—CHARTER; CONVEYANCE; TITLE; and GRANT.

BOUNTY is a sum of money given to encourage men to enter the army or navy. In time of peace, when there is little or no need to augment the forces, the B. sinks to a minimum; but in cases of exigency, it is raised according to the difficulty and urgency of the circumstances. In the British army, no B. was paid to recruits until about half a century ago; the temptations offered to them, if any, were of some other character. The highest B. ever paid during the great wars against Napoleon was in 1812, when it amounted to £18, 12*s.* 6*d.* for limited service, and £23, 17*s.* 6*d.* for life; but these sums were in great part nominal, being subject to many unfair and absurd deductions. Even so late as 1849, when the B. to an infantry recruit was nominally £4, he received little more than one eighth of this amount, all the rest being swallowed up in fees and drawbacks of various kinds. The only B. which now exists is a free kit—no other being allowed. The young men who used to enter the British army were supposed, for the most part, to have been tempted by immediate B. rather than by prospective pays and pensions; and thus it arose that the rate of B. varied frequently, while those of pay and pensions underwent very little change. In 1855, it was £7 per head (for line infantry); in 1856, only £2; in 1858, £3; and it afterwards underwent further changes. It was always higher to the cavalry and artillery than to the infantry; and in the latter it was higher to the Highland than to the other regiments, on account of matters connected with dress and personal ornaments. The relation which the B. bore to the other emoluments of the soldier are explained under ENLISTMENT, RECRUITING. In reference to seamen, the subject will receive elucidation under MANNING THE NAVY.—The term B. is also used in the navy to signify the payment and distribution of money to which the officers and crew of her majesty's ships and vessels of war may, on particular occasions of active service, be entitled. See PRIZE, SALVAGE, BOOTY.

BOUNTY, a term applied to any sum granted by the legislature towards creating or encouraging some kind of undertaking believed to be of national importance. At one time there was no end to the giving of bounties in this way from the public purse—there were bounties on exporting corn, with a view to encouraging agriculture; there were bounties on the tonnage of vessels employed in the herring and whale fisheries; on the importation of materials of manufactures; on the importation of indigo from the colonies; on the exportation of Irish linen, etc. The fallacy of this costly and factitious process for fostering commerce, manufactures, and agriculture was amply demonstrated by Adam Smith in his *Wealth of Nations;* one of his more striking facts being, that every barrel of herrings which sold for 20*s.*, cost the government about 25*s.* The notion that bounties may properly be given as an encouragement in the infancy of undertakings, has been happily exploded. It is ascertained that, besides taxing the general community in order to reward or encourage individuals, bounties do no real good to the parties so favored; for by such inducements they engage in business for which they have no special vocation, or which, in existing circumstances, it would be preferable to let alone. Misdirection of capital, talent, and industry are, in short, the inevitable result of bounties, as of all measures alleged to be for the special protection of trade. The subsidies in the form of extra rates paid to certain steamboat companies for carrying the mails may be said to be the last remnant of British bounties. The carrying of the mails, as involving greater responsibilities than ordinary goods, is paid at much higher rates, even where the ordinary traffic is remunerative, as on the Atlantic route, which

is crossed by the greatest number of steamboat lines. Here the post-office, after a trial of open competition for the conveyance of the mails, in 1878 returned to the system of special contracts with certain of the most reliable companies at increased rates. These contracts have been objected to in the house of commons as monopolies.

BOUNTY OF QUEEN ANNE. See QUEEN ANNE'S BOUNTY.

BOUQUET OF WINE is the peculiar flavor yielded by the better class of wines, and which is due principally to the presence of œnanthic ether. See WINE.

BOUQUETIN, or IBEX of the Alps (*capra ibex*), a species of goat which inhabits the highest regions of the Alps, even higher and wilder than those inhabited by the chamois, up to the limits of perpetual snow. It is the *ibex* of the ancients. See IBEX. In German Switzerland, its name is *steinbock*. It was at one time found on all the higher Alps, but has disappeared from most of them, and exists chiefly on those between the Valais and Piedmont, where it is carefully protected by the Sardinian government. It is larger and more powerful than the common goat, and has a small head and great horns (those of the male 1½ to 2 ft. long), which curve backwards, are directed a little outwards, and have prominent transverse knots or bands on the front. The horns of the females are only about 6 in. long. The hoofs are large, rough on the sole, and capable of being spread widely apart, to give greater security of footing. The general color is brown. The body is covered with two kinds of hair, the longer hair being mixed, at least in winter, with thick soft wool. There is no beard, except a few hairs in winter, although the animal has been often incorrectly figured as having one.

The B. feeds on the herbage and small shrubs which are found on the last confines of vegetation, and descends by night to browse in the highest forests, the lichens and branches of which supply much of its winter food. It is capable of enduring great cold, and will remain, with seeming indifference, for hours on the summit of a rock, motionless, during the most severe storm. It possesses an extraordinary power of bounding from crag to crag, and of ascending or descending almost perpendicular precipices. Even the projections of a wall of rough masonry have been seen to suffice for the feet of a tame one to take hold of. One has also been known frequently to spring from the ground, without a race, and plant itself on a man's head. Tschudi rejects as a fable the statement which has been repeated by one naturalist after another, from the days of Gesner, that the B. throws itself down precipices, so as to fall upon its horns, their elasticity preserving it from injury.

Bouquetin.

When taken young, the B. is easily tamed. It readily associates with common goats, and breeds with them, and the hybrids produce young, of which, however, it does not appear that in any case both parents have been ascertained to be hybrids.

Whether this animal might not be made useful to the inhabitants of such countries as Iceland and Greenland, no one seems to have thought of trying.

BOURBAKI, CHARLES DENIS SAUTER, of Greek descent, b. Paris, 1816; a sub-lieut. of zouaves in 1836, and in 1838 lieut. in the first regiment of the foreign legion. In 1842, he was capt. of zouaves; in 1846, maj. of the native skirmishers, and rapidly rose to be gen. of division. He won great distinction at the Alma, at Inkermann, and in the assault on Sebastopol. He also participated in the Italian expedition in 1859. In 1869 he was commander of the second camp at Chalons, and aid-de-camp to the emperor. In the war with Germany he had an important part in the conflict around Metz, and in the unsuccessful attempt to break through the German lines. In Dec., 1870, he was made chief of the badly demoralized army of the north, which he reorganized; and with it he fought several severe battles. He was at last compelled to retreat toward Switzerland, and in Jan., 1871, he was driven over the Swiss frontier with the remnant of his army. B. was so much discouraged by his many disasters that he attempted suicide, but the wound (a pistol shot in the head) was not fatal. It was said that this act was because Gambetta charged him with treason. After peace he returned to France and received a military command at Lyons.

BOURBON, a co. in s.e. Kansas on the Missouri border and the Little Osage and Marmiton rivers, 576 sq.m.; pop. '70, 15,076; '80, 19,541. The railroads are the Missouri river, Fort Scott and Gulf, and the Missouri, Kansas, and Texas. Agriculture is the chief occupation. Co. seat, fort Scott (100 m. from Kansas city), with a pop. of about 4500.

BOURBON, a co. in n.e. Kentucky, on the South Licking river; 400 sq.m.; pop. '70, 14,863—6677 colored. It is a fine agricultural region, and has among its attractions sulphur and chalybeate springs, and a curious ancient earthwork. The celebrated Bourbon whisky takes its name from this county. The Kentucky Central and the Paris and Mayville railroads traverse the county. Co. seat, Paris.

BOURBON, a French family of the highest note in history, and which came to possess several European thrones, derives its name from the castle and seignory of Bourbon, in the former province of Bourbonnais, in the center of France. The first lord *or sire* of this family, of whom history makes mention, was Adhémar, at the beginning of the 10th century. The fourth in succession from him, Archambauld I., added the name of the family castle to his own. Under his successors, who also bore the name of Archambauld, the family possessions were soon very much increased. At length the seignory of Bourbon having devolved upon an heiress, who, in 1272, married Robert, the sixth son of Louis IX. of France, thus passed to a branch of the royal family of the Capets, under whom it was converted into a duchy. The principal branch of this family was, in 1523, deprived of all its dignities and possessions, because the duke, Charles de B. (q.v.), the famous constable, allied himself with Charles V. against Francis I. of France.

Of the collateral branches, that of Vendôme acquired great importance, first attaining by marriage, in the person of Antoine de B., duke of Vendôme, to the throne of Navarre; afterwards by inheritance to the throne of France, in the person of Henry IV., on the extinction of the male line of the house of Valois; and by the fortune of war to the thrones of Spain and Naples. Among the numerous other collateral branches may be mentioned those of Montpensier, De la Marche, Condé, Conti, Soissons, and Orleans. Only a few members of the collateral lines, however, have borne the name of B.; for example, the cardinal Charles de B., duke of Vendôme, who, under the name of Charles X., was set up by the Catholic league as a rival king to Henry IV. The ducal dignity was revived by Louis XIV. in the house of Condé, so that the eldest son of that house should bear the title of duke of Bourbon.

The dynasty of the Bourbons in France begins with Henry IV. (q.v.), who, after the assassination of Henry III., became, in virtue of the Salic law (q.v.), the next heir to the French throne. Through his father, Antoine de B., king of Navarre and duke of Vendôme, he was descended from Robert, son of Louis IX., and husband of Beatrix, heiress of Bourbon. On his assassination in 1610, he left, by his second wife, Mary de' Medici, five legitimate children: 1. Louis XIII. (q.v.), his successor on the throne; 2. J. B. Gaston, duke of Orleans (q.v.), who died in 1660, and left no male heirs; 3. Elizabeth, married to Philip IV. of Spain; 4. Christina, married to Victor Amadeus, afterwards duke of Savoy; 5. Henrietta, married to Charles I. of England.—Louis XIII., on his death in 1643, left two sons by his queen, Anne of Austria: 1. Louis XIV. (q.v.), his successor; and 2. Philip, who received from his elder brother the title of duke of Orleans, and was the founder of the family which has become the younger B. dynasty.—The dauphin Louis, styled monsieur, the son of Louis XIV. by his marriage with Maria Therese of Austria, died on 14th April, 1711, and left three sons by his marriage with Maria Anna of Bavaria: 1. Louis, duke of Burgundy (q.v.); 2. Philip, duke of Anjou, who afterwards became king of Spain, as Philip V.; 3. Charles, duke of Berri, who died in 1714.—Louis, duke of Burgundy, died in 1712. By his wife, Maria Adelaide of Savoy, he had three sons, of whom two died in early youth, the only one who survived being Louis XV., who succeeded his great-grandfather, Louis XIV. in 1715.—Louis XV. having married Maria Leszcynska, daughter of the dethroned king Stanislaus of Poland, had by her a son, the dauphin Louis, who married Maria Josepha of Saxony, and died in 1765, leaving three sons: 1. Louis XVI. (q.v.), who succeeded his grandfather, Louis XV., in 1774; 2. Louis Stanislaus Xavier, count of Provence, afterwards Louis XVIII.; 3. Charles Philippe, count of Artois, afterwards Charles X.—Louis XVI. had three children by his queen, Marie Antoinette of Austria: 1. The dauphin Louis, who died in 1789; 2. Louis, called Louis XVII. (q.v.), who died in 1795; 3. Marie Therese Charlotte, styled Madame Royale, afterwards duchesse d'Angoulême (q.v.).—Louis XVIII. had no children; but Charles X. had two sons: 1. Louis Antoine de B., duke of Angoulême (q.v.), who was dauphin prior to the revolution of 1830, and died without issue in 1844; 2. Charles Ferdinand, duke of Berri (q.v.), who was murdered in 1820. The duke of Berri left two children: 1. Marie Louise Therese, styled Mademoiselle d'Artois, married to the duke of Parma; 2. Henry Charles Ferdinand Marie Dieudonné, duke of Bordeaux, now styled count de Chambord, the representative of the elder branch of the Bourbons, till June, 1871, exiled from France, and whom the French legitimists sometimes designate Henry V.

It has already been stated that the founder of the Orleans or younger branch of the B. royal family of France, was Philip, duke of Orleans (q.v.), the younger brother of Louis XIV. He d. in 1701, leaving, by his second marriage with Elizabeth Charlotte of the Palatinate, a son of his own name as his heir, who was regent of France during the minority of Louis XV. His son, Louis Philippe, duke of Orleans (b. 1703), married a princess of Baden, and died in 1752, leaving an only son of his own name (b. 1725, d. 1785), whose son and heir was that Louis Joseph Philippe, duke of Orleans (q.v.), so

notable in the French revolution, who in 1792 renounced his rank, taking the name of Citizen Egalité, and died by the guillotine in 1793. He left four children: 1. Louis Philippe (q.v.), who, before the revolution, was styled duke of Chartres—that being the ordinary title of the eldest son of the Orleans family—became afterwards duke of Orleans, was king of the French from 1830 to 1848, and d. in England on the 26th of Aug., 1850; 2. the duke de Montpensier, who died in England in 1807; 3. the count de Beaujolais, who died at Malta in 1808; 4. Adelaide, styled Mademoiselle d'Orleans, b. 1777, d. 1847.—Louis Philippe left a numerous family by his queen, Amelia of Naples; but his eldest son, Ferdinand, duke of Orleans, lost his life by an accident on the 13th of July, 1842, leaving by his wife, the princess Helen of Mecklenburg-Schwerin, two sons, the eldest of whom, Louis Philippe Albert, now styled count of Paris, is the representative of the younger or Orleans B. family.—Concerning the other members of Louis Philippe's family, see the article LOUIS PHILIPPE.

Louis XIV. having succeeded in placing his grandson, Philip, duke of Anjou, on the throne of Spain, in 1700, as Philip V., this prince became the founder of the Spanish B. dynasty, as well as of the B. dynasties of Naples, Parma, and Piacenza. These dynasties endured only a temporary overthrow from the policy and arms of Napoleon Bonaparte. Philip V. was succeeded on the Spanish throne by his son, Ferdinand VI., who died without issue in 1759, and the crown fell to his brother, Charles III., whose son and successor, Charles IV., was compelled to resign it in 1808, in favor of a successor nominated by Napoleon, and died at Rome in 1811. The two eldest sons of Charles IV. by his marriage with Maria Louisa of Parma were—1. Don Fernando, prince of Asturias, who, after the overthrow of Napoleon, ascended the Spanish throne as Ferdinand VII. (q.v.), and whose eldest daughter reigned till 1868; 2. Don Carlos (q.v.), who, on the death of his elder brother in 1833, became pretender to the Spanish throne until 1845, when he resigned his pretensions in favor of his son, count de Montemolin. He died at Trieste, 1855. The count de Montemolin died in 1861, and his claims to the Spanish throne are now represented by his nephew, Don Carlos, son of his brother Juan.

Philip V. did not succeed in keeping possession of the crown of the Two Sicilies (see NAPLES) as of that of Spain; the house of Hapsburg being restored there in the person of a son of Leopold I., who in 1720 ascended the throne as Charles III. But in consequence of the peace of Vienna, the son of Philip V. became king of the Two Sicilies, likewise by the name of Charles III. Upon his accession to the throne of Spain in 1759, he gave up that of Sicily to his third son, Don Fernando, called Ferdinand IV., with the express stipulation that it should never again be occupied by a king of Spain. Ferdinand IV. was compelled to yield to the French arms in 1806; but after the overthrow of Napoleon, he became king of the Two Sicilies as Ferdinand I. (q.v.). His son, Francis I., left the throne in 1830 to his son Ferdinand II. (q.v.), whose son, Francis II., was expelled in 1860, when Naples was incorporated with the new kingdom of Italy.

By the peace of Aix-la-Chapelle in 1748, Austria made over the duchies of Parma and Piacenza to Don Philip, the youngest son of Philip V. of Spain, but with stipulation of their reversion to Austria on the failure of his male descendants, or on his succeeding to the throne of Spain. He was succeeded in 1765 by his son, Ferdinand I., whose son, the hereditary prince Charles Louis Ferdinand, was made king of Etruria in 1801, under the guardianship of his mother, Maria Louisa of Spain; but Etruria being soon incorporated with France, they were completely dispossessed. The congress of Vienna assigned Parma and Piacenza for life to Maria Louisa of Austria, the spouse of Napoleon, but meanwhile indemnified Maria Louisa of Spain with the duchy of Lucca. In 1847, Parma and Piacenza reverted to the B. family, in the person of the former king of Etruria, Charles Louis de B., who had succeeded his mother in Lucca in 1824. He abdicated on Mar. 14, 1849, and was succeeded as duke of Parma and Piacenza by his son, Charles III., and he in 1854 by his son Robert—born 1848—whose mother, Maria Louisa Theresa de B., daughter of the duke of Berri, then became regent of the duchies. The B. family lost these duchies in 1859. See ITALY and PARMA; and see Coiffier-Demoret, *Histoire du Bourbonnais* (1828); Achaintre, *Histoire Chronologique et Généalogique de la Maison Royale de Bourbon* (1825); also histories by Mure (Par. 1860–68) and Dussieux (1869).

BOURBON, CHARLES, Duke du BOURBONNAIS, styled CONSTABLE DE BOURBON, b. 1489, was the son of the count of Montpensier; and in consequence of the death of his elder brother, and his marriage with the only daughter of the duke of Bourbon, he united in his own possession the vast estates of both these branches of the Bourbon family. Holding a very high position in virtue of his birth and wealth, he soon showed himself to be no ordinary character, by the brilliancy of his exploits in arms, and by his rigid morals and severe taciturn disposition. At the age of 26, he received from Francis I. the constable's sword, and was sent to Italy at the head of an army, which he disciplined on the march: and crossing the Alps by passes previously deemed impracticable, he surprised the hostile generals, won the battle of Marignan, 1515, and within a few days placed the keys of the citadel of Milan in the king's hand, acquiring for himself by these exploits the reputation of the greatest general of his time. But Maria Louisa, the king's mother, became enamored of the brave constable; and he, although a widower,

declined her hand, openly declaring that he deemed her a woman devoid of modesty and not to be thought of for a wife. Her revenge led to the seizure, on behalf of the crown, of the estates which he had acquired through his wife, and the withholding of his pay as constable. Thus deeply injured, he renounced the interest of France, and concluded a private alliance with the emperor Charles V., and with Henry VIII. of England. The former agreed to give him in marriage his sister, Eleonora, who had Portugal as her jointure, and to make an independent kingdom for him of Provence and Dauphiné, with his own possessions of the Bourbonnais and Auvergne. The rest of France was to be apportioned between the two confederates. The king, who was engaged in an expedition to Italy, received intelligence of this conspiracy. Forthwith he proceeded in person to the constable, and offered him restoration to favor and also of his estates. The constable, however, did not trust him, but fled in disguise, and reached Franche Comté in 1523. In order not to appear as a fugitive to the Spanish army, which awaited him in Lombard, he drew around him 6000 German lancers, and soon contrived to gain their entire attachment. He attacked, in 1524, the French army on its march over the Alps, and thought to have advanced to the heart of France with the Spaniards, whose general he had been appointed by the emperor. But Charles V. did not entirely trust him, and appointed the marquis of Pescara to assist and watch him. He was compelled to relinquish the siege of Marseilles, on the approach of Francis I. with a great army. He repassed the Alps, and took his revenge in the battle of Pavia, 24th Feb., 1525, where the king was made a prisoner. He now went to Madrid, but soon found himself entirely disappointed in his hopes, and was sent back to Lombardy by Charles V. Without money or support, surrounded by daring and mutinous bands, he conceived a plan to found for himself an independent dominion of his own, and to unite himself with France against Spain. Hastily gathering together the wild bands around Milan, he led them against Rome; and on 6th May, 1527, unprovided with things necessary for a siege, appeared before the walls of that city. Resolved to conquer or die, he led up his troops in the most impetuous manner, and eagerly seized with his own hands a scaling-ladder, in order to make his way over a weak place of the walls, when he was mortally wounded by a bullet, which Benvenuto Cellini afterwards asserted that he had shot. His death was kept secret for a time from the storming army under his command. When it departed from Rome two months after, his corpse, which the soldiers would not part with, was taken with them, and buried at Gaeta, under a magnificent monument, which, however, was afterwards destroyed.

BOURBON, ILE DE, or, as it is called at present, **REUNION**, an island in the Indian ocean, the southernmost of the Nascarene isles, laying about 100 m. s.w. from Mauritius, and 360 m. e. from Madagascar. It is one of the most important of the insular colonies of France. It has an area of about 950 sq.m., being about 38 m. in length, and 28 in its greatest breadth. Pop. '73, 193,362, including some hundreds of Chinese, 6000 negroes, 34,500 Indians, and a garrison, and other officials, to the number of about 2000. It may be described as one great mountain mass, of which the highest peaks are the Piton de Neiges—in the center of the island, rising more than 10,000 ft. above the sea—the Grand Bernard, and the Cimandef, in the n., with respective heights of 9500 and 7500 ft.; and in the s.e., the Piton de Fournaise, 7200 ft. high, one of the greatest volcanoes in the world, and one of the most active, its eruptions taking place at least twice every year, and its lava-streams sometimes reaching to the sea. This volcano occupies perhaps one sixth of the island, often changes its crater, and is surrounded by a district of more than 10,000 acres, which is a dreary desert, and is called the *Pays Brûle* (Burned Land). Except in this part, however, the soil is in general extremely fruitful. About a fourth part of the island is cultivated, chiefly along the coast, although much of the interior is of great natural fertility. The scenery is very beautiful. Streams, although not large, are very numerous, and rush in cascades to the sea. The climate, which was once mild and salubrious, is now very unhealthy to Europeans, who cannot reside four or five years on the island without an attack of typhoid fever or dysentery. The s.e. monsoon and hurricanes often make fearful devastation. The plants of Arabia, of the Asiatic archipelago, and of the s. of Europe, succeed equally well here; coffee and cloves are produced, along with the fruits of Italy and Spain. The trade is estimated at about two millions sterling. By far the most important article of export is sugar; coffee, vanilla, cloves, saltpeter, wood for cabinet-making, and dye-woods are the other exports. The value of the exports, which up to 1867 had been steadily increasing, has since then greatly declined, as the crops have repeatedly suffered from cyclones, persistent drought, and blight. The cereals grown in the island are not sufficient for its own wants. Cattle are imported from Madagascar. The capital of the island, and seat of government, is St. Denis, on the n.w. coast, with 9000 inhabitants, a college, a botanic garden, etc. Lat. 20° 52′ s., long. 55° 30′ east. The mean temperature here is 77° F. There is an almost total want of harbors, the whole coast of the island possessing only two tolerable anchoring-places—one at St. Denis, and another at St. Paul, 18 m. further south. The coast is consequently very dangerous. In one year, 1843–44, no less than 11 large vessels were wrecked. B. and Mauritius were discovered by the Portuguese navigator, Mascarenhas, and named afrer him, the Mascarene isles. After the French had begun their attempt to found a colony in Madagascar, they took possession of B. in 1649, giving it that

name, which was changed to Réunion at the revolution, and to Isle Bonaparte in 1809. The name has been varied according to the political changes in France. The French having, in 1720, taken possession of Mauritius, which they named Isle of France, the Mascarene isles were placed under one governor. In 1810, they were taken by the British, but B. was restored to France in 1814.

BOURBON DE L'OISE, FRANÇOIS LOUIS, a notorious character of the French revolution, was b. in the middle of last c. at St. Remy, near Compiègne, and became a procurator in the parliament of Paris. He helped to storm the Tuileries on 10th Aug., 1792. He shortly afterwards obtained a seat in the convention by a trick, presenting himself as the regularly elected deputy for the department of Oise, in which he had actually been defeated by a namesake who was elected also for that of Loiret. The trick was subsequently discovered, but he was not ejected. B. contributed much to bring about the execution of Louis XVI., the insurrection of the 31st May, and the destruction of the Girondists. He was sent to La Vendée, where, however, he loudly condemned the revolutionary cruelties, and appeared in the character of a moderate. Obnoxious on this account to Robespierre and Hébert, and fearing for his head, he urged on with the greatest eagerness the overthrow of the Terrorists on the 9th Thermidor (27th July, 1794). From this time forth, B. showed himself an enemy of the clubs, and a protector of the nobles and the priests. In consequence of the insurrection of 13th Vendémiaire (5th Oct., 1795), he was sent as a commissioner to Chartres, where he behaved harshly and brutally. He passed from the convention into the council of five hundred, became a persecutor of the republicans, and joined a royalist club. The Directory placed him upon the prescription list after the 18th Fructidor (4th Sept., 1797). He was transported to Cayenne, where, in a short time, he died in great misery, tortured with remorse.

BOURBON-LANCY, a French watering-place on Saone-et-Loire, 20 m. n.w. of Charolles; pop. about 4000. Its mineral waters, which were known to the Romans, are useful in rheumatic and nervous affections. There is a hospital here, established by the Marquis d'Aligre.

BOURBONNAIS, a gently undulating, terrace-formed district in the center of France, northward of the high lands of Auvergne, abounding in grain, fruits, wine, iron, marble, and mineral springs. From 1327 to 1523, it formed the duchy of Bourbon, and afterwards, becoming a domain of the crown, it formed a separate province of France. It now constitutes the department of Allier, and part of the department of Cher. The capital was Moulins.

BOURBONNE-LES-BAINS, a t. of France, in the department of Haute-Marne, about 20 m. e.n.e. of Langres. It is pleasantly situated at the confluence of the Borne and the Aspace, and has some fine promenades and manufactures of cotton hosiery and cutlery. Its chief feature, however, is its saline springs, which range in temperature from 121° to 136° F., and are much resorted to by people suffering from chronic complaints or old wounds. Pop. '76, 3705.

BOURBON-VENDÉE. See NAPOLEON-VENDÉE.

BOURDALOUE, LOUIS, one of the greatest pulpit orators of France, was b. at Bourges, 20th Aug., 1632, and having, at the age of 16, entered into the order of Jesuits, obtained in succession the chairs of humanity, rhetoric, philosophy, and theological ethics in the academy of his native place. He showed a great capacity for science, but his remarkable powers of eloquence led his superiors finally to determine upon employing him as a preacher. Disdaining the inflated style prevalent among the tasteless pulpit orators of his time, he assailed with manly vigor and truly religious earnestness the passions, weaknesses, and errors of men. The dignity of his manner and the fire of his eloquence made him famous even when the public mind was occupied with the festivities of Versailles, the victories of Turenne, and the literary master-pieces of Corneille and Racine. At the court of Louis XIV. he was remarkably well received. After the revocation of the Edict of Nantes, he was sent to Montpellier, in 1866, to labor among the Protestants on behalf of the Roman Catholic church. B. particularly understood how to accommodate his eloquence to the minds of those whom he addressed. Simple among the simple, a dialectician among ecclesiastics, he was equally a favorite with the common people and with the learned and the great. He was also much esteemed and beloved as a man; and in all circumstances, maintained unimpeached a high reputation for candor and honesty. In the later years of his life, he relinquished the pulpit, and devoted his time to hospitals, prisons, and pious institutions. He died at Paris 13th May, 1704. How thoroughly his religious sentiments were governed by the theological tenets of his church, may be perceived from these remarkable words which he uttered on his deathbed: "It is highly reasonable that God be fully satisfied; and at least in purgatory I will suffer with patience and with love." Several editions have appeared of the collected works of B. (as 16 vols., Versailles, 1812, and most recently in the *Panthéon Littéraire*, 8 vols., Par. 1838). The best edition of his sermons is that published under the care of Bretonneau (16 vols. and 18 vols., Par. 1707–34). His life was written by Madame de Pringy.

BOURCHIER, JOHN, Lord Berners, 1474–1532; a descendant of Thomas of Woodstock, duke of Gloucester. B. was educated at Oxford, and was first known by quelling an insurrection in Cornwall. Henry VIII. made him chancellor of the exchequer for life, and he had charge of the king's sister Mary when she went to France to wed Louis XII. At Henry's command he translated Froissart's *Chronicles*, and he also translated the famous *Romance of King Arthur*, *The Exploits of Hugh of Bordeaux*, the *Golden Book* of Marcus Aurelius, and *The Castle of Love*. He also composed a comedy, *Ite in Vineam*, which it was customary to act at Calais after vespers.

BOURDEILLES. See BRANTÔME, *ante*.

BOURDON (in music), a drone bass produced by a bagpipe or hurdy-gurdy; also an organ stop, consisting of stopped wooden pipes, usually of 16 ft. tone. It is found on manuals as a "double" stop, and as a soft foundation stop on the pedal organ.

BOURDON, LOUIS PIERRE MARIE, 1799–1854; a French mathematician, professor in several colleges in Paris, inspector of studies, and a member of the council of the university. His *Elements* of arithmetic and algebra were widely used, the algebra, adopted by prof. Davies of West Point, becoming well known in this country.

BOURG, ANNE DU, 1521–59; a French Protestant martyr. He took orders in the Roman Catholic church, but because he became a Calvinist he left the pulpit for the bar, and was imprisoned as a heretic by Henry II. When Francis II. became king, B. asked for release, but about that time one of the judges who had presided at his trial was assassinated, and B. was hanged and his body was burnt.

BOURGELAT, CLAUDE, founder of the first veterinary school, and consequently the first to institute a distinct profession of veterinary surgeons. Born in Lyons in 1712, he died there in 1799. He was a learned lawyer, an able writer, and the bosom-friend of the great D'Alembert, enjoying also the esteem of Pembroke, Voltaire, Buffon, and Haller. He was instigated to further the cause of veterinary science from a natural liking for horses, and conceived the idea of educating men to alleviate their infirmities and those of other domestic animals. In the execution of this project he found a friend and collaborator in a minister of Lyons, Bertin; and in 1761, the first veterinary school was opened in the suburbs of the city. It was patronized by royalty, and students flocked to it from all parts of France, Italy, Switzerland, Germany, Sweden, and Denmark. Probably the only dark spot in B.'s veterinary career is his treatment of Vial de St. Bel, who, persecuted by his colleagues in France, came to England, and founded the St. Pancras college, Camden Town, London, in 1792. B. had, however, endowed the Lyons school with so much vital energy that it has maintained itself in the foremost ranks. From it all other colleges in Europe sprang, and with them it has kept pace, being superior to the majority, and rivaling the very best, even those of Paris and Berlin.

B. wrote much—his works on farriery, materia medica, external form, contagious diseases, and on the various apparatus and bandages used for quadrupeds, being still highly esteemed.

BOURG-EN-BRESSE, a t. of France, capital of the department of Ain, pleasantly situated on the left bank of the Reyssousse, about 20 m. e.s.e. of Macon. It is well built, has several public fountains, a statue to Bichat, the celebrated anatomist, who was a student at the hospital here, a museum, a fine corn-market, and a public library of 19,000 volumes. The distinguished astronomer, Lalande, was a native of B. It has manufactures of linen, cotton, hosiery, and leather, and a trade in agricultural produce. The town was captured by the allies in 1814. Pop. '76, 14,289.

BOURGEOIS, a type used in book and newspaper printing. When "solid" nine lines fill an inch and a slight fraction over. It is smaller than long primer and larger than brevier. One thousand *ems* of bourgeois occupy 13.86 square inches.

BOURGEOISIE, a French term, but now not unfrequently employed in English, German, and other languages. It denotes the citizens of towns as a rank or class of society, including persons from the condition of heads of manufacturing or mercantile establishments, down to master-tradesmen. The French B. have long been extremely hostile to the aristocracy, but have themselves latterly become the object of attack on the part of the operatives and of the extreme radical or red republican party. The term *bourgeois*, from which B. is formed, is quite distinct in meaning from *citoyen*, the latter term designating a citizen of the state.

BOURGES, the capital of the department of Cher, in France, situated in a fertile plain at the confluence of the Auron and the Eure, 123 m. s. of Paris. B. is divided into an old and new town, the latter being built round the former. Its houses are of antique architecture, and its streets crooked and dirty. It was formerly surrounded by ramparts flanked with high towers, some of which still remain; but the ramparts have been converted into promenades. B. has one of the noblest Gothic cathedrals in Europe, lighted by 59 splendid painted windows. Its university was suppressed at the revolution. B. has greatly prospered since the railway has reached it. In 1861, it was chosen to be one of the military arsenals of France, and its strategical importance has become greater since the loss of Metz. Pop. '76, 31,102. B. is of great antiquity, being the *Avaricum* of the Gauls, in the country of the *Bituriges Cubi*. Taken by Cæsar in 52 B.C.,

it was afterwards named *Bituriea*, and became the capital of the Roman province of *Aquitania Prima*. In the middle ages, it was the capital of the province of Berri. Charles VII. had his residence at B., when almost all France had been taken from him by the English; and its hôtel de ville was originally the abode of his unfortunate minister, Jacques Cœur. Louis XI. was born at B. Of the seven ecclesiastical synods held at B., that of 1438—in which the pragmatic sanction of the Gallican church was established with approbation of Charles VII., and the resolutions of the council of Basel, relative to the papal power and the king's prerogatives, were confirmed—was the most important.

BOURIGNON, ANTOINETTE, a celebrated religious visionary, b. at Lille 13th Jan., 1616. Her father was a merchant, and she inherited from him a considerable patrimony. She was so ugly an infant that there was some thought of killing her as a monstrous birth. Her intellect, however, was very acute, and its powers were early developed, along with a tendency to religious mysticism, which was much encouraged by the reading of mystic books, till her imagination became inflamed, and she began to fancy that she saw visions, conversed with God, received special revelations, and was called to restore the pure spirit of the gospel. By the good offices of the archbishop of Cambray, she obtained admission into a convent, where she won over some of the nuns to her opinions, and soon found herself at the head of a considerable party. She afterwards had charge of a hospital at Lille, but from this position she was driven in consequence of her extravagant fancies. She now traveled through various countries, her enthusiasm gaining proselytes, whose conversion, she said, caused the pains of childbirth in her person. At last she was appointed head of a hospital in e. Friesland. She died at Franeker, 30th Oct., 1680. According to Madame B., religion consists in internal emotion, and not in either knowledge or practice. Her own character exhibited a strange combination of pride and avarice, with a sort of mystic piety. She never gave anything to the poor, alleging as a reason that she had consecrated all to God. Some of her pretended revelations were of the most indecent nature; many of them were extremely ridiculous; yet many persons of intelligence and learning believed in them, and adopted the peculiar form of mysticism which soon began to receive the name of Bourignianism. Among the chief expounders of it was Peter Poiret, a Calvinistic minister. It spread to a remarkable extent both among Roman Catholics and Protestants; and about the end of the 17th c., and beginning of the 18th, prevailed so much in Scotland that a solemn renunciation of it was demanded from every entrant on the ministry at his ordination. A minister of Aberdeen was deposed for it in 1701. The formal renunciation of Bourignianism is still continued in the established church of Scotland, but has been given up as needless by other Presbyterian churches. The works of Madame B. were edited by Poiret (25 vols., Amst. 1676-84; 2d edit. 1717). They exhibit not a little fiery eloquence.

BOURMONT, LOUIS AUGUSTUE VICTOR DE GAISNE, Count de, a French marshal, and the conqueror of Algiers, was b. in 1773 at his paternal castle of Bourmont, in Anjou; went into exile at the revolution, served as an officer in the army of the prince of Condé, and from 1793 to 1796 was actively engaged in the anti-revolutionary struggle in La Vendée. Subsequently, he obtained the favor of the first consul. Under the empire he was appointed to a colonelcy in the army of Naples, and was soon raised to the rank of brig.gen. In the campaigns of 1813 and 1814, he distinguished himself upon a number of occasions, particularly in the battle of Dresden, and by the defense of Nogent, upon account of which Napoleon promoted him to the rank of a gen. of division. On 31st Mar., 1814, he declared for the Bourbons, and received the command of a military division during the first restoration; yet, on Napoleon's return, he went over to him, and was intrusted with the command of a division of the army of the Moselle. On the evening before the battle of Ligny, he deserted and betook himself to Louis XVIII., at Ghent. There can be no doubt that B. was singularly ungenerous in choosing such a moment to resign, nor is there anything in his career to make us suppose he was actuated by any high principle in what he did. His evidence went a considerable way in bringing about the condemnation and execution of marshal Ney. He received high military employment under Louis XVIII. Distinguishing himself in the chamber of peers as a zealous supporter of the king, he was appointed minister of war in 1829, and in this office displayed great activity. When the expedition against Algiers was undertaken in April, 1830, he received the chief command of the troops, and the rapid success of the expedition was ascribed to his prudence and energy. For this he received the marshal's baton on 22d July, but on the revolution taking place in that month, he was superseded in his command, and went to England to share the exile of Charles X. Refusing to take the legal oath, he was struck off the lists of the French army and peerage in 1832. In 1833, Dom Miguel of Portugal placed him at the head of his troops, but the campaign was brief and unsuccessful. B. finally settled on his estate in Anjou, and died there in Oct, 1846

BOURNE, HUGH, the founder of the sect of Primitive Methodists, was b. 3d April, 1772, at Fordhays, in Staffordshire. Originally a preacher among the Wesleyan Methodists, he distinguished himself by the fervor of his religious sentiments, and by the zeal which he displayed for the conversion of the ungodly. His enthusiasm for "revivals" and

open-air meetings, however, received no countenance from the leading clergymen of the denomination to which he belonged. In 1808, B. was cut off from the Wesleyan connection, strange to say, for following much the same course of earnest evangelization as Wesley himself had done. He was not, however, alarmed. His preaching was wonderfully acceptable, and he quickly gathered round him many devoted adherents. In Mar., 1810, a committee of ten members was formed. This may be regarded as the first official organization of the body. In 1818, B. published, in the *Primitive Methodist Magazine*, a narrative of his labors and those of his coadjutors. In the course of his life he visited Scotland, Ireland, Canada, and the United States, where his ministrations were attended with great success. He died at Bemersley, in Staffordshire, 11th Oct., 1872.

BOURNE, VINCENT, one of the most elegant Latin versifiers that England ever produced, was b. about the close of the 17th century. In 1714, he entered Trinity college, Cambridge; in 1721, he took his degree of A.M., and subsequently he was appointed usher in Westminster school. He died Dec. 2, 1747. It would be difficult to praise too highly B.'s exquisite contributions to Latin poetry. They will stand comparison, not only in point of Latinity, but also in point of originality, with the choicest productions of the ancient Roman poets. A gracefulness which pervades thought, sentiment, and expression, is their essential characteristic. The subject is indeed often insignificant, but the treatment is always perfect. His translations of English ballads and other lyrics into Latin are wonderfully felicitous, every beauty being retained with the most delicate skill, and every defect being most carefully remedied. Cowper, Beatty, Charles Lamb, and others have expressed their admiration of B.'s singularly fine *genius*, for assuredly a gift so rare as that which enables a man to find a complete utterance for his ideas in a dead tongue, deserves the name. The first edition of B.'s poems appeared in 1734. Their number was enlarged in a subsequent edition.

BOURNEMOUTH, an English watering-place on the Hampshire coast, 5 m. from Christ church; pop. '71, 5906. In 1855, a sanitarium for consumptive patients was erected, and several similar establishments have since been founded. The town has churches, hotels, a library and reading-room, and assembly rooms, baths, and a pier 800 ft. long. The climate is remarkable for equality of temperature. The surrounding country is very beautiful.

BOURNONITE, or ENDELLIONITE, is a triple sulphate of antimony, lead, and copper, in the proportions of 19.4 sulphur, 26 antimony, 41.8 lead, and 12.8 copper. It is found in massive crystals.

BOURNOUSE is the Arabic name of a garment worn in Algeria, Morocco, and other parts of n. Africa. It is a large woolen mantle, worn above the other attire of the natives, and having a hood, which is thrown over the head in rainy weather. The B. is generally white, though distinguished individuals wear it of various colors—blue, green, red, etc. It has been long in use among the Spaniards under the name of *albornoz*. Through the conquest of Algeria by the French, the B. was imported into France and England, although its original form has been considerably altered.

BOURRIENNE, LOUIS ANTOINE FAUVELET DE, the secretary and early friend of Napoleon I., was b. at Sens, 9th July, 1769, and received his education in the military school at Brienne, where he formed the closest intimacy with the future emperor. He became, in 1792, secretary to the embassy at Stuttgart. Deprived of this office by the breaking out of war, he lived for some time a rather retired life, until, in 1797, his former school-fellow appointed him his secretary. He accompanied him to Egypt and to Italy, and in 1801 was nominated a councilor of state. In 1802 he was dismissed from his office, for being implicated in the dishonorable bankruptcy of the house of Coulon, army-contractors; but in 1805 he was appointed ambassador to the states of the Circle of Lower Saxony, and in this capacity resided long at Hamburg. His tendency to peculation, however, necessitated his return to France, where he had to refund 1,000,000 francs into the public treasury. He now decidedly joined the party which sought the overthrow of the emperor and the restoration of the Bourbons. He was treated with little consideration by them during the first restoration, yet he followed Louis XVIII. in his flight to the Netherlands upon Napoleon's return, and upon the second restoration was honored with the title of a minister of state. As deputy from the department of Yonne in 1815 and 1821, he showed his weakness of character by opposing all liberal measures, and even institutions for the promotion of science and popular education. The revolution of 1830, and the loss of his fortune (occasioned by extravagance), caused his reason to give way, and he died in a lunatic asylum at Caen, 7th Feb., 1834. His Memoirs concerning Napoleon, the Directory, the Consulate, the Empire, and the Restoration (*Mémoires sur Napoleon*, etc., 10 vols., Par. 1829), gave many new explanations of his events of the time, but were declared by contemporaries to be in many respects untrustworthy. See the article BOULAY DE LA MEURTHE. The work, however, is one which must always constitute an important part of the materials of history. A work entitled *Histoire de Bonaparte par un Homme qui ne l'a pas quitté depuis 15 Ans*, has been erroneously ascribed to him.

BOURSAULT, EDMUND; 1638–1701; a French dramatist and satirist. Louis XIV. directed him to prepare a book for the education of the dauphin, and he produced *The*

True Study for Sovereigns, which so pleased Louis that he asked B. to become tutor to his son, but being ignorant of Latin he was compelled to decline. Two of B.'s dramas, *Esope à la Fille*, and *Esope à la Cour*, were very popular, and Carville declared one of his tragedies to be worthy of Racine. B. accused Molière of impiety, and assailed the *School for Women* in his *Portrait of a Painter*, to which Molière retaliated by contemptuously calling B. "L'Impromptu du Versailles." B.'s *Satyre des Satyres* was directed against Boileau, whom, however, he afterwards generously offered to assist; in return for which kindness Boileau erased B.'s name from his satires.

BOURSE. See EXCHANGE, *ante*.

BOUSSA, a t. of Sudan, Central Africa, capital of a district of the same name, is situated on an island in the Niger, in lat. 10° 14′ n., and long. 5° 20′ east. It is hemmed in by rocks, and being also surrounded by walls, is a place of very considerable strength. Pop. estimated at from 10,000 to 18,000. A melancholy interest attaches to B. as being the death-scene of Mungo Park (q.v.).

BOUSSINGAULT, JEAN BAPTISTE JOSEPH DIEUDONNÉ, a French chemist, particularly distinguished for investigations relative to agriculture, was born at Paris, 2d Feb., 1802, attended the mining school at St. Etienne, and went in the employment of an English mining company to South America, where, besides his professional and scientific labors, he served as a col. under Bolivar in the South American war of liberty. Returning to France, he was appointed professor of chemistry at Lyons, and in 1839 was admitted into the institute, and appointed to the chair of agriculture in the conservatory of arts and measures, Paris. In 1848, he was elected a member of the constituent assembly, and voted with the moderate republicans. After the *coup d'état*, he retired from political life. In 1857, he was made commander of the legion of honor. His *Economie Rurale* (2 vols., Par. 1844; 2d ed., Par. 1849) embodies the result of experiments and investigations which have won for him a European reputation. It contributed much to the promotion of the infant science of agricultural chemistry, and has been translated into English (Lond. 1845) and German. B. is the author of numerous valuable papers in scientific periodicals, which were collected and published in 1854; and he is also the author of *La Fosse à Fumier* (1858), and *Agronomie, Chimie agricole, et Physiologie* (1864).

BOUSSO'LE STRAIT passes through the Kurile islands, uniting the sea of Okhotsk and the Pacific ocean. Lat. 46° 30′ north. It takes its name from one of the vessels of La Perouse, who, soon after Cook's death, nobly emulated, on the n.e. coasts of Asia, that navigator's explorations on the n.w. shores of America.

BOUSTROPHE'DON (Gr. *bous*, an ox, and *strepho*, I turn), a word used to describe a mode of writing practiced by the Greeks in the earlier period of their history—viz., in which the lines did not proceed uninterruptedly from left to right, but alternately, the first line being written from right to left, the second from left to right, etc. Examples are frequently found in coins and inscriptions. The method received its name from its resemblance to the path made by oxen in plowing a field.

BOUTERWEK, FRIEDRICH, a German philosophical and æsthetical author of merit, was born on 15th April, 1766, at Oker, near Goslar, in the Harz district. He at first devoted himself to the study of law; but in the second year of his academic course at Göttingen he relinquished it, imagining that his proper vocation was to be a poet. Besides poems, he wrote the romance of *Count Donamar* (*Graf Donamar*, 3 vols., Gött. 1791–93; 2d ed., 1798–1800). Not finding, however, that success which he expected in this career, he renounced it, and devoted his whole energies thenceforth to the study of philosophy and of the history of literature. In philosophy, he was at first a zealous follower of Kant, but afterwards adopted the system of Jacobi. He began to give lectures in Göttingen in 1791, and became extraordinary professor of philosophy in 1797, and ordinary professor in 1802. He produced several works on philosophy; but his great work, on which his reputation really depends, is his *History of Modern Poetry and Eloquence* (*Geschichte der neuern Poesie und Beredsamkeit*, 12 vols., Gött. 1801–1819), one of the best works of its kind which Germany has produced. The part relating to Spanish literature is especially valuable, and has been translated into Spanish and much enlarged by Jos. Gomez de la Cortina and Nic. Hugelde de Molinedo (3 vols., Madrid, 1828). B. died at Göttingen in 1828.

BOUTS-RIMÉS (Fr. "rhymed endings") are a kind of verses the making of which forms a social amusement. Some one of the party gives out the rhymes or endings of a stanza, and the others have to fill up the lines as they best may. Suppose the rhymes prescribed are *wave, lie; brave, die;* the following are two of the ways in which the lines might be completed:

Dark are the secrets of the gulfing wave,
Where, wrapped in death, so many heroes lie;
Yet glorious death's the guerdon of the brave,
And those who bravely live can bravely die.

Whenever I sail on the wave,
O'ercome with sea-sickness I lie;
I can *sing* of "the sea," and look brave;
When I *feel* it, I *feel* like to die.

BOUTWELL, GEORGE SEWALL, LL.D., b. Mass., 1818; the son of a farmer, self-instructed after a common-school course; at the age of 18 a student at law, but never a practitioner, having turned his attention to politics. He was seven times chosen to the Massachusetts legislature, and became the leader of the democratic party in his state. He was three times defeated for congress, and once for governor, but was chosen governor in 1851 and re-elected the next year. On the repeal of the Missouri compromise he left the democratic and assisted in the organization of the republican party, in which he soon acquired a prominent position. In 1862, as commissioner, he organized the new department of internal revenue; in 1863, was elected to congress and twice rechosen. In 1868, he was one of the managers of the impeachment of president Johnson; from 1869 to 1873, secretary of the treasury, and then elected to the United States senate. In the financial business of the government, both as a legislator and an executive officer, Boutwell had a large share of influence and responsibility. He has also been overseer of Harvard college, and secretary of the Massachusetts board of education, in which capacity he prepared many valuable reports. He is the author of *Educational Topics and Institutions*, and a *Manual of the United States Direct and Revenue Tax*. His last political office was as a member of the Massachusetts constitutional convention of 1875.

BOUVARDIA, a genus of plants of the natural order *cinchonaceæ* (q.v.), and of the same tribe with the *cinchona* (q.v.), or Peruvian bark. The calyx is 4-partite, with teeth between the segments; the corolla tubular and 4-fid; the stamens 4, included within the corolla; the capsule 2-celled. The species are natives of Mexico. One of them, *B. triphylla*, with oblong ternate leaves and trigonous branches, has obtained a place among the favorite ornaments of flower-borders in Britain, but requires careful protection from frost. To preserve it, the roots are generally taken up, and are sometimes placed in a greenhouse or frame for the winter, sometimes in a dry cellar. Its beautiful corymbs of scarlet flowers are produced from June till November.

BOUVART, ALEXIS, 1767–1843; a Swiss astronomer, educated in Paris, and in 1804 a member of the bureau of longitudes. He assisted La Place in the *Mecanique Celeste*, and became a member of the academy. Bouvart was the first to point out the irregularities of the planet Uranus, and the investigation of these irregularities led to the discovery of Neptune by Le Verrier and Adams.

BOUVET, JAOCH., a learned French Jesuit, who was sent by Louis XIV. to China, to acquire information concerning that country, which he reached, along with five other missionaries, in July, 1686. Being invited to Pekin, the missionaries received permission to disperse themselves over the whole Chinese empire, except B. and Gerbillon, who were required to remain in attendance upon the emperor, the famous Kanghi, whose respect and confidence they soon acquired in a high degree. He committed to them the erection of great buildings, and was so pleased with their performances, that he not only caused a church and a residence for them to be built within the bounds of his palace, but commissioned B. to return to his native country, and to engage as many missionaries as he could find. B. arrived in France in 1697, and brought with him, for the king, about fifty Chinese works. He returned again to China in 1699 with ten new missionaries, amongst whom was the learned Parrenin. He died at Pekin, June 28, 1722, after having labored indefatigably in the cause of science, in that distant scene, for fifty years. He has left four different accounts of his various travels, and a work entitled *Etat Présent de la Chine, en Figures Gravées, par Griffart* (Par. 1697).

BOVEY COAL is a form of wood-coal or lignite, which derives its name from being found at Bovey, in Devonshire.

BO'VIDÆ (Lat. *bos*, an ox), a family of ruminating mammalia (see RUMINANTIA), to which different limits have been assigned by different naturalists, but which is generally regarded as equal in extent to the Linnæan genus *bos*, or to what is popularly called the ox tribe. The B. are all large animals, with stout limbs and broad muzzle. The facial outline is nearly straight. Their dentition agrees with that of some of the other ruminants, as sheep, goats, and antelopes: they have eight cutting-teeth in the lower jaw, and none in the upper, but instead of them, a fibrous and elastic pad, which covers the convex extremity of the anterior maxillary-bone; they have no canine teeth, but a large interval between the cutting-teeth and the grinders, which are six on each side in each jaw. In eating, they collect and roll the grass together "by means of the long and movable tongue; it is firmly held between the lower cutting-teeth and the pad, the cartilaginous upper lip assising in this; and then, by a sudden nodding motion of the head, the little roll of herbage is either torn or cut off, or partly both torn and cut." Both sexes are furnished with unbranched tapering horns, which are directed more or less laterally, and generally upwards and forwards, and are usually curved throughout their whole length. There are, however, breeds of the common ox, in which both sexes are destitute of horns. The tail is rather long, and terminated by a tuft of long hair. The females have four teats. All the B. are gregarious. Native species are found in Europe, Asia, Africa, and North America. Fossil remains of species which no longer exist have been found in pliocene and pleistocene deposits. The number of existing species is by no means certain; as, besides the difficulty of deciding in some cases what are to be deemed species, and what merely varieties, there is still a great deficiency of

accurate information concerning the B. of different parts of the world. The very magnitude of the animals has probably prevented so frequent a comparison of specimens as would otherwise have taken place. It has recently been ascertained that the number of species is more considerable than had been supposed. Attempts have been made to divide the genus *bos* into several genera, but they are not very clearly nor strongly distinguished. All the B. are valuable to man, for their flesh, tallow, skin, etc.; but some of them, having long been reduced to domestication, are among the most valuable of all domestic animals, particularly the common ox, different kinds of buffalo, and the yak of Tartary.—See ARNEE, BANTENG, BISON, BUFFALO, GAUR, GAYAL, GALLA OX, MUSK OX, OX, PEGASSE, URUS, YAK, ZAMOUSE, ZEBU, etc.

BOUVIER, JOHN, 1787–1851; b. France; of a Quaker family; practiced law in Philadelphia, and became associate justice of the court of criminal sessions. In 1839, he published a *Law Dictionary*, which was accepted as a standard work, especially adapted to this country. His chief effort, however, was the *Institutes of American Law*. An only daughter, Hannah M., became proficient in astronomical sciences, and published *Familiar Astronomy*, with a *Treatise on Globes*.

BOVALI, BOUALI, or BOALI, a t. in Africa, capital of the kingdom of Loango, in 4° 30′ s., and 12° 1′ e., on a river of the same name, not far from the coast. It is in a fertile but unhealthy region, and has a large trade in pepper, ivory, dye-woods, and slaves. Pop. 15,000.

BOVIA'NUM, a city of ancient Italy, near the site of the present Bojano, believed to have been founded by the Samnites, and represented by Livy as a rich and powerful town. It was captured by the Romans, 311 B.C.; in the second Punic war it was the head-quarters of the Roman army, and in the Social war the capital of the confederates.

BOVINES, or BOUVINES, a village in Flanders, 7 m. s.e. of Lille, on the Marcq, where, July 27, 1214, Philip Augustus of France, defeated Otho IV. of Germany. In 1240, Philip of Valois defeated the English, and May 18, 1794, the French defeated the Austrians, at the same place.

BOVINO, a fortified t. in the province of Foggia, s. Italy, about 20 m. s.s.w. of Foggia. It is the see of a bishop, has a cathedral, churches, and convents. The valley of B. was formerly notorious as the haunt of the brigands of Capitanata, and the town still enjoys the unenviable reputation of being the nursery of all the highway robbers of this portion of the Apennines. Pop. 7900. B. occupies the site of the ancient *Vebinum*. The imperialists defeated the Spaniards here in 1734.

BOW, of a ship, is a general name for the forepart, or that which breasts the waves. Very often the word is used in the plural, the ship being considered to have starboard and larboard, or right and left bows, meeting at the prow or figure-head. A narrow or *lean* bow, and a broad or *bluff* bow, are seamen's phrases for different shapes of bow, each of which has its own peculiar advantage at sea: a narrow bow will cut more smoothly through the water, but a broad bow bears up more firmly in a high sea.

"On the bow," in sea-language, is the position of a distant object when seen over the bow; it implies a sweep of one quarter of the horizon, embracing about 45° on each side of the prow or head.

BOW AND ARROW. In ARCHERS AND ARCHERY will be found a brief account of the military arrangements under which bowmen formed a component element in the armies of the middle ages; and under ARBALEST is a description of the cross-bow, which was once so favorite a weapon. We here describe the more effective, though simpler implement. The long-bow first gained ascendency in England in the 14th century. It was found that a dozen arrows could be discharged from this weapon while the arbalester was winding up his cumbrous cross-bow, and discharging one arrow or quarrel from it. Moreover, the long-bow being held vertically, the bowmen were able to stand in closer array than the arbalesters; they were enabled also to take a greater supply of the munitions of war into the field, seeing that the bow and arrows were much lighter in weight. In the time of Edward III., a bow was priced 1*s.* to 1*s.* 6*d.*, and a sheaf of arrows, 1*s.* to 1*s.* 2*d.*; in the time of Henry VIII., the price (fixed by law) of the bow varied from 6*d.* to 3*s.* 4*d.* The last-named monarch adopted extraordinary means for encouraging the use of the long-bow. Many ordinances were issued for insuring a good supply of bow-staves. The bowyers, string-makers, fletchers, and arrow-head makers were all placed under stringent regulations. Merchants were compelled to import good bow-staves with cargo, in certain proportions. Very long bow-staves were admitted duty-free. Yew was considered the best wood; but in order that the supply should not be too speedily used up, bowyers were ordered to use elm, ash, and wych-hazel in certain proportions to yew. The heads of families were bidden to provide bows for their sons and servants; and town-councils or officers were required to provide shooting-butts just outside each town. Some of the bows had two arches, connected by a middle straight piece. The best length was regarded as about 5 ft. 8 in. from nock to nock; but in earlier times, some of the bows were much longer. The first arrows were made of reeds; these materials were afterwards superseded by cornel-wood; but the wood finally adopted as the best was ash. The arrows had heads pointed with steel, sometimes barbed to render their action more terrible. They were feathered with portions of goose-wing. The best

length for a bow of the above-named size was set down at 2 ft. 3 inches. Sometimes the arrows were tipped with combustibles. The best makers of arrow-heads, as well as bows, were compelled by law to go from town to town, to exercise their craft wherever it was most needed. The bowman usually carried 24 arrows, called a sheaf, or a quiver, at his right side or at his back; besides others in his girdle. He kept his bow in a case; hence Falstaff's comparison of prince Hal to a bow-case, in allusion to his slenderness. Bowmen, in their hours of sport, used arrow-heads called *rigged, creased, shouldered*, and *spoon-headed*, according to the shape.

The circumstances attending the decline of the use of the long-bow are narrated in the articles above cited.

BOWDICH, THOMAS EDWARD, an enterprising African traveller, b. at Bristol in June, 1790, was first engaged in trade in his native city, but afterwards appointed a writer in the service of the African company. Selected, in 1816, to conduct a mission to the king of Ashantee, he published an account of it in 1819, 4to. On his return to Europe he resided for some years in Paris. To obtain funds for a new expedition into the interior of Africa, he published a translation of Mollien's *Travels to the Sources of the Senegal and Gambia*, and other works, and in Aug., 1822, sailed from Havre. He died of fever on the river Gambia, Jan., 10, 1824. A profound scholar and accomplished linguist, B. was a member of several literary societies both in England and on the continent.

BOWDITCH, NATHANIEL, an American astronomer of some note, b. 26th Nov., 1773, at Salem, in Massachusetts. He showed at a very early age a great inclination for mathematics, in which he afterwards made great proficiency, without ever attending a university. He was at first bred to his father's trade of a cooper, and afterwards apprenticed to a ship-chandler. He acquired Latin that he might study Newton's *Principia*. He particularly devoted himself to the study of the practical applications of science. He went as supercargo of a merchant-ship in several long voyages, and added a thorough practical acquaintance with navigation to a theoretical knowledge of it. His work, *The American Practical Navigator*, was received with great favor. He published also an admirable translation of La Place's *Mécanique Céleste* (2 vols., Boston, 1829), to which he added valuable annotations. These works obtained for him marks of honor from scientific societies in Britain, and led to his being called to the professorship of mathematics and astronomy in Harvard college, in his native state, which situation, however, he declined, in order to enter the executive council of the state. He afterwards became manager of the Massachusetts life insurance association, president of the mechanics' institute, and president of the academy of arts and sciences in Boston. He died 16th March, 1838.

BOWDOIN, JAMES, LL.D., 1727–90; b. Boston; a descendant of Pierre Bowdoin, Huguenot refugee from France; a graduate from Harvard in 1745; representative in the general court, senator, and councilor. He was an early opponent of English oppression, and in 1775 he was chosen president of the colonial council of government. In 1778, he presided over the convention to form a constitution. In 1785, he was chosen governor, succeeding John Hancock in that office. He proved his executive ability by a prompt suppression of the "Shay's rebellion." In 1789, he was a member of the convention that ratified the federal constitution. B. was one of Franklin's friends and correspondents; and one of the founders, and the first president, of the academy of arts and sciences, to which he gave his library. He also left a legacy to Harvard college, and was a liberal patron of the state humane society. The oldest college in Maine bears his name.

BOWDOIN, JAMES, 1752–1811, son of gov. Bowdoin; a graduate of Harvard, studied also at Oxford, and traveled in Europe, returning to America soon after the battle of Lexington. In 1805, he was United States minister to Spain. He left to Bowdoin college 6000 acres of land, with the reversion of the island of Naushon, and also a large library and extensive collection of philosophical apparatus.

BOWDOIN COLLEGE, the oldest and one of the most important seats of learning in Maine, in the village of Brunswick, near the Androscoggin river and the ocean, named after James Bowdoin, gov. of Massachusetts, of which state Maine was formerly a province. The charter was granted by the Massachusetts legislature in 1794, and five townships of land were given towards the foundation. The object of the institution, in the language of the charter, was "to promote virtue and piety, knowledge of the languages, and of the useful and liberal arts and sciences." A dual government was formed, consisting of a board of trustees and a board of overseers. Joseph McKeen, a Dartmouth graduate, was the first president, chosen in 1801, and John Abbott, a Harvard graduate, was made professor of languages. Eight students were accepted in 1802, and in 1806 the first honors of the new college were conferred upon eight graduates. At this time the entire college and the residences of professors were in a single house. On the death of president McKeen in 1807, Jesse Appleton, D.D., became president, and held the chair for twelve years, during which time he did much to advance the efficiency and importance of the institution. James Bowdoin, son of gov. Bowdoin, had given the college 1000 acres of land and about $5000, and at his death gave, in addition, more land and many valuable mineralogical specimens, books, and paintings. William Allen, D.D., who had been president of Dartmouth college, was the next president (1819). He was in office for twenty years, except for a short period in 1831, when he had a con-

troversy about authority with the newly organized state of Maine. The controversy was ended by a decision in his favor by the U. S. circuit court. After Dr. Allen, Leonard Woods, D.D., was president until 1866. He was followed by Samuel Harris, S.T.D.; and in 1871, Dr. Harris gave place to Joshua L. Chamberlain, LL.D. At the present time there are six or more spacious and well-arranged brick buildings, besides the chapel and memorial hall, which are of granite. The college is governed by 11 trustees and 40 overseers, the president and vice-president being two of the trustees. At the latest reports, there were 12 professors and 140 students. The curriculum is of the usual variety, some of the languages, however, being optional. For undergraduates there is a scientific course, in which the degree of B.S. is conferred. There is a post-graduate course of two years in philosophy and the arts. Those of the graduates who have honorably finished a post-graduate course may be appointed fellows, and reside at the college two years, with all the privileges, without further charge. Military instruction is also given. The medical school has 9 professors and 93 students. Among the benefactors of the college, besides James Bowdoin, have been Mrs. Amos Lawrence, and Daniel W. Lord of Kennebunkport. Of notable graduates there may be named Hawthorne and Longfellow, who had among their fellow-students William Pitt Fessenden, George B. Cheever, D.D., Franklin Pierce (president of the United States), John P. Hale, Sargent S. Prentiss, Calvin E. Stowe, D.D., and Luther V. Bell. Mr. Longfellow was professor of languages until he removed to Harvard. The prevailing religious sentiment of the college is Congregational.

BOWEN, FRANCIS, LL.D., b. Mass., Sept. 8, 1811; graduate of Harvard, and instructor there in political economy and intellectual philosophy. In 1843, he became editor of the *North American Review*, in which capacity he acted 11 years. In 1850, he was proposed for professor of history in Harvard, but was not appointed, his views on the Hungarian revolt and other political topics being unsatisfactory to the board of appointment. In 1853, he succeeded Dr. Walker in the Alford professorship of natural religion, moral philosophy, and civil polity. He has lectured and published largely on the application of ethical and metaphysical science to the evidences of religion, on political economy, on the origin and development of English and American political constitutions, on English philosophers, etc., and opposing Mill, Comte, Kant, Cousin, and Fichte. Some of his works are: *Critical Essays on the History and Present Condition of Speculative Philosophy; Principles of Political Economy applied to the Condition, Resources, and Institutions of the American People;* an annotated edition of *Virgil*, and a revision of Reeves' translation of De Tocqueville's *Democracy in America*.

BOWER (Ang.-Sax., *bur*, a chamber). The "ladies' bower," a private apartment in ancient castles and mansions, used by ladies both as a parlor and sleeping-chamber.

> Up, then, rose fair Annet's father,
> Twa hours of it were day,
> And he is gane into the bower
> Wherein fair Annet lay.
> Ballad of *Lord Thomas.—Percy's Reliques.*

BOWERBANK'IA, a genus of zoophytes (q.v.), of the class *polyzoa* or *bryozoa*, order *infundibulata*, the structure of which has been very carefully studied in the common British species, *B. imbricata*, one of the most abundant zoophytes on the coasts of both England and Scotland. It grows on sea-weeds, corallines, stones, etc., between high and low water-mark, or in no great depth of water, and forms branching tufts sometimes 1½ in. in height. The branches are smooth and transparent, tubular, filled apparently with a granular fluid, and crowded with irregularly scattered clusters of delicate horny ovate or ovato-cylindrical cells, which are so transparent as to permit the most easy observation of their whole internal structure. The polyps which inhabit these cells are all connected with the tube of the branch, and so with the common life of the *polypidom*. Each, when fully expanded, is about one twelfth of an inch in length, and has 10 finely ciliated tentacula. When alarmed, it contracts very rapidly, the tentacula being first drawn in, and then the body of the polyp retracted into its cell. The organization is much higher than in many zoophytes. The mouth does not lead at once into the stomach, but into a funnel-shaped tube, which contracts into a gullet or *œsophagus*, and ends in a globular gizzard, apparently provided with radiating muscular fibers, and intended for trituration of the food. The gizzard opens below into a bag, which is regarded as the true stomach, and is supplied with a fluid, regarded as bile, from minute follicles or sacs in its sides, which follicles are therefore regarded as representing the liver. From the upper part of the stomach, near the entrance from the gizzard, arises the intestine, a straight tube which passes up by the side of the gullet, and terminates in an orifice outside the circle of tentacula; the structure thus exhibiting a strong resemblance to that of the ascidian mollusca. When the polyp is retracted, the gullet is bent upon itself, and the tentacula are inclosed in a tube or sheath formed by the inverted integument. When the polype is vigorous and lively, the cilia of the tentacula are kept in active motion, apparently quite under control of the will of the animal, forming a kind of whirlpool to bring animalcules or organic particles into the mouth.

BOWER-BIRD, a name given to certain Australian birds of the starling (q.v.) family, or *sturnidæ*, remarkable for their habit of making bower-like erections, called *runs* by

the colonists of New South Wales, and for adorning them with gay feathers, rags, bones, shells, and such other white or brightly colored objects as they can pick up. These bowers are not used as nests, but they appear to be places of much resort at the breeding-season in particular. The use made of them by the birds is very imperfectly understood; but their structure has been carefully examined, and fine specimens of them, transported with no little difficulty, have been deposited in the British museum by Mr. Gould, in whose work on the *Birds of Australia* an account of them was first given to the world. The bowers of the satin bower-bird (*ptilonorhynchus holosericeus*) are built among the branches of some tree, and appear to be repaired and frequented from year to year. The base consists of an extensive and rather convex platform of sticks, firmly interwoven, on the center of which the bower itself is built of more flexible twigs. It is chiefly at and near the entrance that the shells, feathers, etc., employed for decoration are are placed. The bowers of the spotted bower-bird (*chlamydera maculata*) are longer and more avenue-like than those of the satin bower-bird; they are placed upon the ground, and are outwardly built of twigs, and beautifully lined with tall grasses so disposed that their heads nearly meet. The decorative propensity appears in the highest degree in this species. "In some of the larger bowers, which had evidently been resorted to for many years," Mr. Gould says, "I have seen nearly half a bushel of bones, shells, etc., at each of the entrances." These are arranged in much the same way at both entrances. Small pebbles are often transported by the birds from considerable distances.

The satin bower-bird is particularly abundant in the mountainous districts of the w. of New South Wales, and is found in all the "brushes" from the mountains to the coast. The adult male has the whole plumage of a deep, shining black. The colors of the female are grayish-green and brown, curiously mingled.—The spotted bower-bird, which is rather smaller than the satin bower-bird, or about the size of a starling, has a general color of rich brown, beautifully marked with black and buff; a band of elongated feathers of light rose-pink crossing the back of the neck, and forming a broad, fan-like, occipital crest. It is exclusively an inhabitant of the interior of Australia.—Another species, the great bower-bird (*chlamydera nuchalis*), considerably larger than either of the others, and very similar in form and plumage to the spotted bower-bird, has been found on the n.w. coast of Australia. Its bowers are always adorned with sea shells, even when at a distance from the sea.

BOWIE, a co. in n.e. Texas, on the Red river and the Arkansas border; intersected by the Texas and Pacific railroad; 892 sq.m.; pop. '80, 10,965—4,292 colored. It has an undulating surface, with rich bottom-lands, and heavy forests; productions, cotton, corn, sweet potatoes, etc. Co. seat, Boston.

BOWIE-KNIFE, an American knife, so called from its inventor, col. Jim Bowie, a famous fighter with the rifle and other weapons, and altogether one of the most daring characters in the southern states of the union. The bowie-knife is a sharp-pointed weapon, and is usually carried concealed in a sheath in the breast, or some other part of the person, ready for any encounter.

BOWIE-KNIFE, (*ante*), a common hunting knife used by south-western pioneers, improved by col. James Bowie, who has been wrongly represented as a bully and a duelist. The bowie-knife is seldom concealed, and it is by no means the commonly used weapon which it is represented to be by foreigners; indeed, of late years it is seldom seen at all unless among hunters or settlers in the extreme frontiers.

BOWING TOWARDS THE ALTAR is an ancient practice in the church, derived from a belief in the superior sanctity of the east. There are scriptural allusions to the east, from which notions of this kind may have been drawn. "And, behold, the glory of the God of Israel came from the east."—*Ezek.* xliii. 2. "For we have seen his star in the east."—*Mat.* ii. 2. There was also an early legendary belief that Christ would come to judgment in the east. For these, not to mention other reasons, it became customary to place the altar, with the crucifix and other symbols, at the eastern extremity of the church, to which all bowed. In the Romish church, the practice is still kept up of bowing towards the altar, or more correctly towards the Host, on entering and departing from the church. Brand's *Popular Antiquities*, edited by sir Henry Ellis, contains much curious antiquarian lore on this subject. It was further a custom in the early Christian church to bow at the name of Jesus. This is still done in the church of Rome, at whatever part of the service the name occurs. In the church of England, it is customary to bow at the name of Jesus only in repeating the *creeds*. This ancient usage is traced to *Phil.* ii. 10, "That at the name of Jesus every knee should bow." Punctilious bowings and turning towards the east in repeating the *creeds*, have in late times given rise to dissensions in the church of England.

BOW ISLAND, an island of coral formation in the s. Pacific, the largest in the Low archipelago, being about 30 m. long and 5 m. broad. It can only be approached by a small opening in the reef at the n. end. Within the lagoon the anchorage is safe. The e. side is well wooded, but the w. is low and barren. Pearl-oysters and other shell-fish abound in the lagoon. The inhabitants are few, ill-looking, and indolent, with a partiality for raw food. The island was first discovered in 1768 by Bougainville, who gave it the name of La Harpe, which Cook, who visited it in the following year, changed to the name it now bears.

BOWLDERS. See BOULDERS, *ante.*

BOWLES, SAMUEL, 1826–78; b. Mass.; a journalist, for more than 30 years editor of the *Springfield* (Mass.) *Republican*, which he made in some respects the leading journal in New England. He traveled widely over the United States, and was always warmly interested in political affairs, though never holding office. As a practical editor Bowles stood in the first rank, satisfied with nothing less than the best work, sparing neither his own nor his subordinates' strength, not hampered in his work by either fear or friendship. He was an accomplished and fascinating conversationist, cosmopolitan in taste, and liberal in opinion. His travels gave rise to the volumes *Across the Continent; Our New West,* and *The Switzerland of America*, which, with his numerous editorial writings, show him a master of clear and vigorous English.

BOWLES, WILLIAM LISLE, D.D., an English poet, was b. 24th Sept., 1762, at King's Sutton, in Northamptonshire, where his father was then vicar. He received his education at Winchester school, and at Trinity college, Oxford, and became at last a prebendary of Salisbury cathedral in 1803, and rector of Bremhill, in Wiltshire, in 1805. Here he spent, in comparatively affluent circumstances, the remainder of his long life. His poetical career began with the publication, in 1789, of *Fourteen Sonnets, written chiefly on Picturesque Spots during a Journey.* This unpretending little volume was received with extraordinary favor; the sonnets were fresh and natural, and to many minds, all the more charming because of the contrast which they presented to the style of poetry which had long been prevalent. Coleridge, Wordsworth, and Southey were among their enthusiastic admirers; and through the influence which he exercised over them, B. may be regarded as the founder of a school of English poetry, in which their names soon became greater than his own. The subsequent poetical works of B. are very numerous, of which *The Spirit of Discovery* and *The Missionary* are generally regarded as the best of his longer blank-verse poems. As a poet, B. shows a fine appreciation of the beauties of nature, and pleases by the expression of pure and generous sentiment, as well as by playfulness of fancy and perfect scholarly correctness, but he is greatly deficient in vigor and depth. He published an edition of Pope's works in 1807; and an opinion which he expressed on the poetical merits of Pope, led at a subsequent period to a rather memorable controversy, in which Campbell and Byron were his antagonists, and which turned chiefly upon the comparative value in poetry of images derived from nature and those derived from art. B. was generally admitted to have discomfited his opponents. B. frequently employed his pen in defense of the church of England, and endeavored to vindicate all the peculiarities of the older English educational institutions. Of his prose writings may be mentioned a volume of sermons (Lond. 1826), and a rather dry *Life of Thomas Ken, deprived Bishop of Bath and Wells* (2 vols., Lond. 1830–31). B. died at Salisbury on 7th April, 1850, in the 88th year of his age.

BOW-LINE, in a ship, is a rope fastened near the middle of the perpendicular edge of the square sails by three or four subordinate ropes called *bridles.* It is employed to tighten the edge of the sail in a particular direction during an unfavorable wind.

BOWLING GREEN, a t. and seat of justice of Warren co., Ky., 120 m. s.w. of Frankfort, on Barren river, which is navigable to the place by steamboats. Pop. about 6000. It has some manufactures, and trade in tobacco, pork, etc. It is reached by the Louisville and Great Southern railroad.

BOWLS, GAME OF. This is a favorite pastime throughout the British isles. It is played upon a smooth, flat piece of turf, from 40 to 60 ft. square, surrounded by a trench or ditch about half a foot deep. The players arrange themselves in sides, usually of four each, and each man is usually provided with two bowls. The bowls are made of lignum-vitæ wood, of 6 or 8 in. in diameter, nearly round, and with a bias to one side. A smaller ball, perfectly spherical and white, is placed at one end of the bowling-green; this is termed the *jack*, and the aim of the players, who stand at the other end of the green, is to send their B. that they may lie as near as possible to the jack. The side whose B. are nearest the jack reckon one point for each bowl so placed. 7, 14, 21, or 31, make game, according to mutual arrangement beforehand. B. are biassed or weighed on one side, that the player may reach the jack by a curved instead of a straight course, an expedient which the nature of the game renders particularly desirable. Indeed, were it not for this, the game would lack half its charms. A bowl is played *forehand*, when it is so placed in the hand and delivered as to cause it to approach the jack with a curve from the right; and in order to attain this curve, the bowl must be held so that its bias is on the left or in-side. Backhand is the reverse. If a bowl goes into the ditch without touching the jack, it cannot count in the scoring of that end; but if it strikes the jack, and then rolls into the ditch, it reckons as if on the green. When the jack is carried by a bowl into the ditch, it is usually lifted, and placed on the green as near as possible to its position in the ditch. When the B. have so accumulated round the jack, that it is impossible to approach it from either *side*, without running the risk of touching an adversary's bowl, the last player frequently endeavors to *run* the jack, by playing straight at it with such force as to neutralize the bias, and, if fortunate, carry away the jack

from the neighborhood of his opponent's bowls. A *skip* is appointed on each side, whose duty it is to direct each of his men.—For BOWLING at cricket, see CRICKET.

The game of B. was anciently unlawful, and was the subject of prohibitive legislation in England in the reign of Henry VIII.; but the law then enacted was repealed in 1845 by the 8 and 9 Vict. c. 109, s. 1, so that B. or other similar games of mere skill may be legally indulged in by the people.

BOWMAN, THOMAS, D.D., b. Penn., 1817; graduate of Dickinson college, and a minister in the Methodist Episcopal church. He organized Dickinson seminary, at Williamsport, Pa., and presided over it for ten years. In 1858, he was chosen president of Asbury university, at Greencastle, Ind.; he was a delegate to the Bristol conference in 1864, and chaplain to the U. S. senate in that and the following year. In May, 1872, he was made a bishop.

BOWMANVILLE, a t. in Canada, on lake Ontario and the Grand Trunk railroad, 43 m. n.e. of Toronto. It has manufactories driven by water-power, and trade by the lake. Pop. 3000. The harbor is port Darlington, 2½ m. from the town.

BOWRING, Sir JOHN, an English politician, linguist, and author, was b. at Exeter, 17th Oct., 1792. He early devoted himself to the study of languages, in the acquisition of which he displayed an unusual degree of talent. The national poetry of different peoples had particular attractions for him, and he rendered great service to literature by collecting and translating both the more ancient and the more modern popular poems of almost all the countries of Europe. His translations preserve remarkably well both the meaning and the spirit of the original, and exhibit no mean powers of versification. B. was very intimately associated with Jeremy Bentham, who appointed him one of his executors, and intrusted him with the editing of his collected works. A descendant of the old Puritans, he early came forward in writing and speaking against the political disadvantages experienced by dissenters. He took part from the first in the *Westminster Review*, which was established in 1824, and edited it for about five years from 1825. In 1828 he visited Holland; and his letters—which appeared in the *Morning Herald*, and were shortly afterwards translated into Dutch—procured for him the degree of doctor of laws from the university of Groningen. Subsequent travels were undertaken by him, on a commission from the British government, to inquire into the commercial relations of certain states. He visited Switzerland, Italy, Egypt, Syria, and finally the countries of the German Zollverein, and everywhere found materials for valuable reports. He was a member of the house of commons from 1835 to 1837, and again from 1841 to 1849, and actively promoted the adoption of free trade. In 1849, B. was appointed British consul at Hong-Kong, and superintendent of trade in China. He returned in 1853, and in the following year was made knight and governor of Hong-Kong. In 1856, an insult having been offered to a Chinese vessel said to have been under the protection of the British flag, B., without consulting the home government, ordered an attack on certain Chinese forts, a proceeding which excited considerable dissatisfaction in the country, and produced a ministerial crisis. B. afterwards returned to England. In 1855, he concluded a commercial treaty with Siam, and has given an interesting account of his visit in a work entitled *The Kingdom and People of Siam*. He retired on a pension in 1859, and afterwards published an account of the Philippine islands. In 1861, B. was sent on an official mission to Italy. He died in 1872. His *Autobiographical Reminiscences* were published in 1877.

BOW SPRIT is a large boom, spar, or mast, which projects over the stem or head of a ship. Its use is to carry sail forward, as a means of counteracting the effect of the after-sails, and keeping the ship well balanced. It is also the chief support of the fore-mast, which is fastened to it by large stays or ropes. In ordinary ships of war, the B. rises at an angle of about 45° from the horizon, and is generally about two-thirds as long as the main-mast; but in many kinds of vessels the position is more nearly horizontal.

BOWSTRING HEMP, an English name, proposed by Dr. Roxburgh, and partially adopted, for the fiber produced by *sanseviera zeylanica*, a plant of the natural order *Liliacea* (q.v.), tribe *hemerocallea*, a native of the East Indies. The employment of the fiber for making bowstrings led to this name. Dr. Royle prefers to use the Sanscrit name MOORVA, on account of the confusion apt to be caused by applying the term hemp to a variety of fibers.—The genus *sanseviera* is distinguished by a colored funnel-shaped perianth, with a long tube, into the throat of which the stamens are inserted, and a 3-celled and 3-seeded, or abortively 1-celled and 1-seeded, berry. The plants have a general appearance much like that of many species of *iris*, but their leaves are more fleshy; they have a thick creeping rhizome or root-stock; the radical leaves are long and narrow, and the flowering-stems have only scale-like leaves.—Very similar to *S. zeylanica* are *S. Roxburghiana* and *S. lanuginosa*, also natives of India.—These plants grow under bushes in jungles near the sea, where the soil is salt, but may easily be propagated on almost any soil by the shoots which issue in great abundance from the root-stock. They are perennial. The leaves are about 2 ft., or in cultivation 3 or 4 ft. long; the fibers extend their whole length; and to separate the fibers from the pulpy part of the leaves, "the natives place them on a smooth board, then press one end of the leaf down with

one of their great toes, and with a thin bit of hard stick, held between the two hands, they scrape the leaf from them, and very quickly remove every part of the pulp." Steeping in water is also practiced, but it discolors the fiber, which is beautifully white. One pound of clean fiber is obtained from about 40 lbs. of fresh leaves. Dr. Roxburgh calculated that 1 acre would yield 1613 lbs. of clean fiber at a gathering, of which two might be reckoned upon annually in good soil and favorable seasons, after the plants have reached a proper age. Moorva, or B. H., may well be supposed likely to acquire commercial importance. The fiber is hair-like and silky, elastic, and in strength apparently about equal to hemp. It does not rot in water so soon as hemp.—A species of *sansevieria* very similar to the Indian ones, *S. Guineensis*, is found in abundance along a great extent of the w. coast of Africa, specimens of the fiber of which, also fine and strong, have been brought to England under the name of AFRICAN BOWSTRING HEMP.

BOWYER, WILLIAM, an eminent English printer and classical scholar, b. in London in 1699, was educated at Cambridge, and in 1722 joined his father in trade. Appointed, in 1729, printer of the votes of the house of commons, he subsequently became printer to the society of antiquaries, and to the royal society. In 1767, he was nominated printer of the rolls of the house of lords, and the journals of the house of commons. He died in 1777. B. published several philological tracts, but his chief production was an edition of the New Testament in Greek, with critical and emendatory notes. He left a considerable sum in trust to the stationers' company, for relief of decayed printers. A small volume of anecdotes of B. and his learned contemporaries, published soon after his death by Mr. John Nichols, his apprentice and partner, was afterwards enlarged, under the title of *Literary Anecdotes of the Eighteenth Century* (9 vols., 8vo).

BOX, *Buxus*, a genus of plants of the natural order *euphorbiaceæ;* evergreen shrubs or small trees, with opposite leaves, entire at the margins, and easily split into two plates. The greenish inconspicuous flowers grew in little axillary clusters, the male and female flowers distinct, but on the same plant. The male flowers consist of a perianth of four leaves, and of four stamens; the female flowers have a perianth of three or four leaves, and, in addition, three small bracts at the base, an ovary surmounted by three styles, and two honey-secreting glands. The capsule has three beaks and three cells, and two or three black seeds in each cell.—The most important species is the COMMON BOX (*B. sempervirens*), which grows wild in the s. of Europe, and in some parts of Asia. It is generally regarded as a true native of the s. of England, where it grows on dry chalky hills; and is remarkable as the only arborescent species of *euphorbiaceæ* found in such cold latitudes. In Britain, it seldom attains a height of more than 12 or 14 ft., but in warmer countries, it is often twice that height. Its leaves are oval, generally from half an inch to three quarters of an inch in length, smooth and shining, of a deep green color. The B. is remarkable for its compact habit of growth and densely crowded branches and leaves, presenting a very solid mass of foliage. There are several cultivated varieties, distinguished by differently variegated leaves—gold-edged, silver-edged, etc. The most interesting variety, however, is a very humble one, called DWARF BOX, which grows only to a height of 2 or 3 ft., and is very commonly used to form edgings for garden-plots, being kept down by clipping to the height of a few inches. These edgings—than which none are neater, or better serve the purpose of keeping gravel-walks free from earth—are generally formed by planting cuttings, which readily strike root. The B. bears clipping remarkably well; and in a style of gardening once fashionable, but condemned by the taste of the present day, it occupied an important place, being cut into architectural and fantastic figures. The leaves of the B. have a smell which is disagreeable to many people, and a very disagreeable bitter taste. When taken inwardly, they cause purging; an external application of them promotes the growth of the hair. In France, they are sometimes used instead of hops in making beer, but are extremely improper for the purpose. The wood of the B. is heavier than that of any other European tree, and is the only European wood that sinks in water. It is of a beautiful pale-yellow color, remarkably hard and strong, of a fine regular and compact texture, capable of a beautiful polish, and not liable to be worm-eaten. It is much valued for the purposes of the turner and the wood-carver; is preferred to every other kind of wood for the manufacture of flutes, flageolets, and other wind-instruments, as well as of mathematical-instruments; and is unrivaled for wood-engraving, admitting of a finish as sharp and fine as metal, whilst it *takes the ink* much better. See ENGRAVING. When scraped down and boiled, it can be used as a sudorific in many complaints, and as a substitute for guiacum. An empyreumatic oil, obtained from box-wood chips, is used for relief of toothache and for other medicinal purposes. —Spain and Portugal send into the market large quantities of box-wood; also Circassia and Georgia, from which countries it finds its way to Odessa, and is again exported thence. In 1815, as many box-trees were cut down at Box hill, in Surrey, as brought upwards of £10,000, but the tree is of so very slow growth, that it is seldom planted in Britain except for ornament.—The MINORCA BOX, or BALEARIC BOX (*B. Balearica*), a native of Minorca, Sardinia, Corsica, Turkey, etc., is a larger tree than the common B., and has leaves three times as large. It is much less patient of frost, but is occasionally seen in shrubberies in the s. of England. The wood is of a bright yellow, and inferior

to the true box-wood, but is brought in large quantities from Constantinople under that name for wood-engraving.

BOX-DAYS. These are two days appointed by the judges of the court of session in Scotland, in the spring and autumn vacations, and one day in the Christmas recess, on which pleadings or other law-papers appointed by the court, or by one of the judges, towards the close of the preceding session, may be lodged or filed; the object being to expedite the procedure, notwithstanding the vacation or recess. These days are called box-days, in consequence of an act of sederunt or order of the court of session, dated the 29th Nov., 1690, in which the evil custom of private solicitation of the judges is complained of: "For preventing whereof," says the order, "and for easeing the leidges, themselves, and the lawyers, they, according to the example of the most famous judicatories abroad, have appointed *boxes* for every one of the lords, to stand on a bank in the session-house from three o'clock till seven o'clock at night, each box having a slitt, in which the informations or bills may be lett in, and cannot be drawn out, untill the box be opened; the key whereof is to be keept by every judge himself, and to be committed to no other; and each lord is to send for his box at seven o'clock at night, that he may have competent time to peruse all the informations therein, and to consider the same, and the citationes alleged in the same, whereby none of the leidges can be put to trouble to attend any of the lords for giveing their informationes, bills, or answers." Further facilities for legal business in vacation-time are afforded in Scotland by the regulations of the *bill-chamber* (q.v.); and in England the equity and common-law judges attend at chambers during vacation; but to English lawyers the use of boxes, or of any similar expedient, is unknown. See COURT OF SESSION and other COURTS.

BOX ELDER, or ASH-LEAVED MAPLE, *Negundo aceroides*, a small and handsome tree growing along the banks of streams in the middle and southern Atlantic states, and in the west. Sugar is made from it in some of the n.w. states.

BOX ELDER, co. in n.w. Utah, adjoining Nevada; about 6000 sq. m.; pop. '70, 4855. Great Salt lake covers the s.e. portion of the co., and the Central Pacific railroad passes through it. Productions, agricultural. Co. seat, Brigham City.

BOX-HAULING is a particular mode of turning a ship, when the swell of the sea renders tacking impossible, or when the ship is too near the shore to allow room for veering. The operation is effected by a peculiar management of the helm and the sails. *Boxing-off* is an operation very similar to box-hauling. See further under TACK, VEER.

BOXING, or PUGILISM (Lat. *pugilatus*), fighting with the fists. It was practiced as a manly exercise by the ancients, among whom it was an art so highly esteemed, that Pollux, Hercules, and some of the other gods were represented as having excelled in it. The pugilists of the ancient games had leather thongs on their hands, sometimes loaded with lead or iron; this armature of the hand was called the *cæstus*. Of course, their combats ware not unfrequently attended with fatal consequences, which have resulted also in many instances of modern pugilistic encounters, although no armature of the fists is allowed. Among the Greeks, the practice of B. was at first permitted only to freemen, no slave, or person attainted with crime, being considered worthy to possess the high privilege of being beaten to the consistency of a jelly. Gradually, however, B. was taken up as a profession, and its character deteriorated. B. was a favorite amusement of Englishmen for centuries; it is even said to have had such distinguished patrons as king Alfred and Richard III. But the golden age of pugilism as a profession in England commenced with the accession of the House of Hanover; then men calling themselves professors publicly announced their intention of giving lessons in "the noble art of self-defense." One professor challenged another to combat in the most bombastic language. In 1726, one Ned Sutton, who announces himself as "pipemaker from Gravesend, and professor of the noble science of defense," sneers at another professor, whom he calls "the extolled Mr. Figg," for having by "sleeveless pretense" shirked a combat with him, "which I take," says the pipemaker and professor, "to be occasioned through fear of his having that glory eclipsed by me, wherewith the eyes of all spectators have been so much dazzled." He further assures the said Figg, that if he can muster courage enough to fight with him, he (Figg) "will have the advantage of being overcome by a hero indeed!" Figg had an "amphitheater" in Oxford road, wherein fights were held; and a larger one was erected in the same locality in 1742 for one Broughton, the funds being subscribed by some eighty noblemen and gentlemen. The pugilistic encounters that took place here were patronized by many of the nobility. Some faint protests against the brutality of the pastime now began to be made by the press, but these had little effect. Towards the end of the last century, fights were patronized by princes of the blood-royal; and the prince of Wales, afterwards George IV., was present at one at Brighton, in which one of the combatants was killed. When the allied sovereigns and their generals came over to England in 1814, lord Lowther treated them to a series of boxing-matches in his drawing-room, which were so highly relished that they were repeated a few days afterwards. One of the pugilists, called Jackson, became quite a hero, and made enormous sums by giving lessons to young noblemen, among whom was lord Byron. In 1817, the czar Nicholas of Russia witnessed a prize-fight at Coombe Warren. At the close, the victor was presented to him, with whom he shook hands. This was the last time that royalty was present at one of these disgusting spectacles.

The character of the prize-ring, or, as it is called in the slang of its supporters, "the P. R.," had been for many years declining. People of influence and respectability seemed to have withdrawn their countenance from it. The lowest and least reputable class of the population furnished the fighters, and money was the only object of their backers. "Fair-play" was no longer "a jewel" in the P. R.; fights were sold, and the meanest and most disgraceful tricks resorted to, in order to win or to avoid the payment of bets. Prize-fights were under the ban of the law; in many counties of England, the police actively interfered to prevent them; and some railway companies refused to convey those taking part in them along their lines. The year 1860, however, witnessed a strange revival of the pugilistic spirit, on occasion of a fight between Tom Sayers, the "champion prize-fighter of England," and John Heenan, the "Benicia boy," an American, for £200 a side, and the belt, a badge of honor worn by the champion. The battle, which was elevated to the dignity of "a great international contest" by sporting papers, took place at Farnborough, April 17, 1860. It lasted for more than two hours, in which time the American was beaten almost blind, and the Englishman dreadfully bruised. The continuance of the battle was prevented by the breaking in of the ring, caused by the interference of the police. After the fight, the English champion was ranked by many newspapers—not sporting ones—with the heroes of the Crimea and of Lucknow; hundreds, if indeed not thousands, of pounds were subscribed for him, in admiration of his bravery, by persons of all conditions of life, and residing in all parts of the country; and he was fêted by merchants on the London and Liverpool 'changes. His opponent received equally flattering and substantial testimonials from Americans. The fight formed the subject of discussion in the house of commons, in which the home secretary announced that not only the principals, but all present at the spectacle, were amenable to the law. Though no steps were taken to bring the offenders to justice, it was intimated to those chiefly concerned, that if a renewal of the fight were attempted, the law should be put in force against those aiding or abetting it.

The training which prize-fighters undergo for some months before a battle is of the most healthful kind; it rids them of every superfluous grain of flesh, braces their nerves, and makes their muscles like iron; yet, owing to the rude way in which the result of all this training is demolished in an hour's fight, professional boxers are usually very short-lived. With the exception of one, Gulley, who became M. P. for Pontefract, and the Jackson already alluded to, who made a fortune, few of them have ever risen to anything above the ownership of a low public-house, where they lay down the law on pugilism to their admirers, and take the chair at so-called "harmonic meetings," where B. is the entertainment. Prior to the decline of B. the doings of the prize-ring were duly chronicled by sporting papers. The following specimens of the slang will afford a sufficient idea of the character of this kind of literature. The mouth is called the "potato-trap," the "kisser," the "whistler," the "grubber," and the "oration-trap;" the nose is variously described as the "claret-jug," the "smeller," the "sneezer," the "snorer," the "sniffer," the "proboscis," the "nozzle," the "snout," the "scent-bottle," and the "snuff-box;" the ear as the "conk;" and the eyes as the "daylights," the "peepers," the "squinters," the "goggles," etc. Instead of saying that the eyes did not swell up, the *littérateurs* of the P. R. would say that the boxer "did not seem inclined to adopt the early-closing movement with either shutter!"

BOXING-DAY, the day after Christmas, and so called in England from being the day on which *Christmas boxes*, or presents, are given to servants and others. See CHRISTMAS Box.

BOXING THE COMPASS is one among many sea-phrases not easily traceable to their origin. It means simply a rehearsal or enumeration of the several points, half-points, and quarter-points of the mariner s compass, in their proper order; and is among the lessons which a young sailor has to learn.

BOX'TEL, a busy t. in the Netherlands province of North Brabant, is 6 m. s. of Bois-le-Duc. Pop., Jan. 1, '75, 5034, who are employed in agriculture and in manufactures. B. is famed for its table-linens, and beer, leather, paper, and salt are extensively made. It has connection with the leading railways. The Anglo-Dutch army, under the command of the duke of York, was here defeated with great loss by the French in 1794.

BOX-THORN, *Lycium*, a genus of plants of the natural order *solanaceæ*, having funnel-shaped or tubular flowers, and 2-celled berries. The species are pretty numerous, and found in different quarters of the world. Several are natives of the s. of Europe, thorny shrubs, with long slender shoots and simple lanceolate leaves. *L. Europæum* may be trained to a height of 30 or 40 ft., and is often planted—as are also other species—for ornament, to cover walls, etc. It has pale-violet-colored flowers, reticulated with red veins. Some of the species are almost trees. *L. fuchsioides*, although destitute of spines, is used as a hedge-plant in its native country, the Andes of Quito. Its flowers are orange scarlet, and grow in umbels.

BOX-TORTOISE, or LOCK-TORTOISE, *cistudo Virginica*, and *cistudo Blandingi*, characterized by the division of the shell into two parts in such a way that the animal can shut himself entirely into the shell. They have longer legs and run faster than other tortoises, but are harmless and very timid.

BOYA'CA, one of the states of Colombia bordering upon Venezuela and its fellow states of Santander and Cundinamarca; 33,351 sq.m.; pop. '71, 482,874. In the western part of the state is a branch of the Andes, from which the land slopes east in vast prairies, covered to a great extent with marshes and forests, with here and there pastures and cultivated ground, watered by the Orinoco and the Meta. The lowlands are fertile, yielding tropical fruits, sugar, cotton, cacao, tobacco, dyes, drug-stuffs, and timber. In the southern part of the state are many hot springs, the vapors from which in dry weather condense and cover the surrounding country with sulphate of soda, and this is gathered and sold in other sections as a substitute for salt for cattle. There are springs near the capital which are hot by night and cold by day. The climate of the plain is hot and unhealthy; in the valleys it is better, and in the high regions cool. The people have rude manufactures of cotton, wool, straw, etc.; but cattle-raising is the chief business. Gold, lead, and precious stones are found, but not to a great extent. The forests are infested with dangerous wild animals, serpents, and venomous insects. Capital, Tunja, where the Zaques kings once reigned.

BOYA'CA, a t. of the United States of Colombia, near which, in 1819, Bolivar, by a victory over the Spaniards, secured the independence of Colombia. It gives its name to the department, which stretches from the plateau of Bogota to the borders of Venezuela, being watered by the Magdalena, Sogamozo, Zulia, Cazanare, and Meta. The capital, however, is not B. itself, but the neighboring city of Tunja, which is about 70 m. to the n.n.e. of Bogota.

BOYAR. See BOJAR.

BOY'AU, in military engineering, is a winding or serpentine trench, dug to form a path or communication between the different armed trenches of a siege-work, and to prevent them from being enfiladed, or fired upon in flank.

BOY-BISHOP. The custom of electing a boy-bishop on St. Nicholas's day dates from a very early period. Warton thought he could find some allusion to it in one of the anathemas of the Constantinopolitan synod, 867 A.D. It quickly spread over most Catholic countries, and in England seems to have prevailed in almost every parish. Although the election took place on St. Nicholas's day (6th Dec.), the authority lasted to Holy Innocents' day (28th Dec.). The boy-bishop was chosen from the children of the church or cathedral choir, or from the pupils at the grammar-school. He was arrayed in episcopal vestments, and, attended by a crowd of subordinates in priestly dress, went about with songs and dances from house to house, blessing the people, who, as bishop Hall says, "stood grinning in the way to expect that ridiculous benediction." The boy-bishop exacted implicit obedience from his fellows, who, along with their superior, took possession of the church, and performed all the ceremonies and offices except mass. The custom found countenance not among the populace only. In 1299, Edward I., on his way to Scotland, permitted a boy-bishop to say vespers before him at Heton, near Newcastle-on-Tyne, and gave him and his companions a present. At Salisbury—and perhaps in other places also—the boy-bishop, it is said, had the power of disposing of such prebends as happened to fall vacant during the days of his episcopacy; and if he died during his office, the funeral honors of a bishop, with a monument, were granted him. What secular shows and entertainments accompanied this practice, history does not inform us. Probably dramatic exhibitions of a rude nature were the principal. In England, the custom of electing a boy-bishop was abolished by a proclamation of Henry VIII., dated July 22, 1542; restored by queen Mary in 1554; and again abolished during the reign of Elizabeth, though it seems to have lingered here and there in villages till about the close of her reign.

BOYCE, WILLIAM, 1710–79, an English musician, the son of a mechanic, who became an organist and conductor of the royal orchestra. His compositions are mainly church-music, and many of them are still in use. He was the author of two musical dramas, *The Chaplet* and *The Shepherd's Lottery.*

BOYD, a co. in n.e. Kentucky, on the Ohio and Big Sandy rivers; intersected by the Lexington and Big Sandy railroad; 230 sq.m.; pop. '80, 12,165—557 colored. It has a hilly surface, with plenty of hard coal and iron ore. Productions agricultural. Co. seat, Catlettsburg.

BOYD, ANDREW KENNEDY HUTCHISON, D.D., b. Ayrshire), 1825; a Scotch preacher and writer, educated at Glasgow university; a member of the established church, stationed at St. Andrews. He is the author of *Leisure Hours in Town; Gracer Thoughts of a Country Parson; Present Day Thoughts,* and other popular works.

BOYD, JOHN PARKER, 1768–1830; an American soldier, native of Massachusetts, who went to India, where he raised a little army of 500 men (a few of the officers being English), with arms, elephants, etc., which he let to such native princes as chose to hire their services, impartially preferring the highest offer. The trade grew dull, and in 1808 he sold his army and came home, fought as a colonel in the battle of Tippecanoe, and became brig. gen. in 1813. He published some documents relating to the war of 1812.

BOYD, ZACHARY, an eminent Scottish divine, born before 1590, was educated at Kilmarnock, and studied at the universities of Glasgow, and Saumur in France, of which latter he was, in 1611, appointed a regent or professor, and is said to have declined the

principalship. The persecutions of the Protestants in France caused him to return to Scotland in 1621. In 1623, he became minister of the Barony parish, Glasgow, and was thrice elected rector of the university of that place. His principal prose work, *The Last Battell of the Soule in Death*, published at Edinburgh in 1629, in 2 vols., was reprinted, with a life of the author, by Gabriel Neil, Glasgow, 1831. He was author of eighteen other works, chiefly of a religious cast. The third edition of his *Psalmes of David in Meeter* appeared at Glasgow, 1646. He died in 1653 or 1654, leaving numerous MSS., and his library, with a considerable legacy, to the college of Glasgow, over a court gateway of which is his stone bust, whilst his portrait is in the divinity hall of the same university. Among his MSS. is a collection of quaint poems on Scriptural subjects, entitled *Zion's Flowers*, usually called Zachary Boyd's Bible. As a specimen of his homely style, the following extract from Jonah's soliloquy within the whale's belly may be quoted here:

What house is this, where's neither coal nor candle,
Where I nothing but guts of fishes handle?
I and my table are both here within,
Where day neere dawned, where sunne did never shine;
The like of this on earth man never saw,
A living man within a monster's maw,
Buried under mountains which are high and steep,
Plunged under waters hundreth fathoms deep.
Not so was Noah in his house of tree,
For through a window he the light did see;
He sailed above the highest waves—a wonder;
I and my boat are all the waters under;
Hee in his arke might goe and also come,
But I sit still in such a straitened roome
As is most uncouthe, head and feet together,
Among such grease as would a thousand smother.
I find no way now for my shrinking hence
But heere to lie, and die for mine offence.
Eight prisoners were in Noah's hulk together;
Comfortable they were, each one to other.
In all the earth like unto me is none,
Far from all living, I heere lye alone.

BOYDELL, JOHN, a liberal patron of art in England, b. in 1719. At the age of 21, he apprenticed himself for seven years to an engraver in London, and on the expiration of his apprenticeship, published, by subscription, a series of views in England and Wales, with the profits of which he set up a print-selling business in the metropolis. English engraving was at a low ebb when B. threw his money and intelligent energy into the work of its improvement. Under B.'s liberal patronage of native artists, the importation of foreign prints, for the most part, not only ceased, but English prints were exported to the continent. B. now determined to do for English painting what he had done for engraving. He accordingly selected Shakespeare's works for illustration; and in the carrying out of his object, secured the most eminent painters in the kingdom, including Opie, Reynolds, Northcote, and West. The result was the magnificent "Shakespeare Gallery," from which was engraved a superb volume of plates (Lond., Boydell, 1803). B. also published, at Bulmer's press, a splendid edition of Shakespeare's works in 9 vols. (1792–1801). The immense sums of money he spent on the Shakespeare illustrations, and the commercial depression consequent on the French revolution, brought him into difficulties, from which he was not wholly extricated before his death, in Dec., 1804. An alphabetical catalogue of plates containing engravings by the best artists, from the finest works of the Italian, Flemish, German, French, and English schools; sketches from Claude Lorraine, etc., were among the collections published by Boydell.

BOYDEN, SETH, 1785–1870; b. Massachusetts; an American inventor; began making patent leather in 1819; invented a machine for splitting leather, and a process for making spelter. In 1826, he made the first malleable cast-iron. Among other inventions was one for making hat-bodies, and a process for making Russia sheet-iron. He built the first successful locomotive that had the cylinders outside of the frame.

BOYER, ALEXIS, Baron de, a French surgeon of the greatest eminence, was b. at Uzerche, in Limousin, on 30th Mar., 1757, or, according to others, in 1760. He was for some years in the service of a notary, before he began his medical studies. In 1787, he was appointed second surgeon to the hôspital de la charité at Paris, and afterwards professor, first of operative surgery, and then of clinical surgery, at the École de Santé. In 1804, he was appointed first surgeon to the emperor, who also raised him to the rank of baron. He accompanied the emperor on his campaigns and journeys. After the restoration, B. became professor of practical surgery in the university of Paris, and first surgeon at the hôspital de la charité. In 1823, he was appointed consulting surgeon to the king; and in 1825, was admitted a member of the institute. He died on 25th Nov., 1833. His greatest works are his *Traité Complet d'Anatomie*, 4 vols. (Par. 1797–99. and other editions), and his *Traité des Maladies Chirurgicales et des Opérations qui leur conviennent*, 8 vols. (Par. 1814–22). From 1798 to 1817, he was engaged with Roux and Corvisart in conducting the *Journal de Médicine Chirurgie et Pharmacie*.

BOYER, JEAN BAPTISTE NICHOLAS, a French physician, 1693–1768. He devoted his life to the investigation and treatment of contagious diseases, and with much success.

The courage and ability which he displayed during the plague in Marseilles procured him a pension and the place of physician in ordinary to the king. His best known works are *Account of the Plague at Marseilles in* 1720, and *Observations on the Epidemic that prevailed at Beauvais.*

BOYER, JEAN PIERRE, a mulatto, president of the republic of Hayti, was born 2d Feb., 1776, at Port-au-Prince, capital of that part of the island then belonging to France. At a very early age he was sent to France, where he received a European education; and in 1792, entered the military service. He very soon became a *chef de bataillon*, and fought against the British on their invasion of his native isle. After further fighting against the British under gen. Rigaud, leader of the mulattoes, and afterwards under gen. Leclerc, he entered into a combination which had for its object the union of the negroes and mulattoes, and a complete emancipation of the colony. After the negro Dessalines had seated himself upon the throne, B., along with Péthion, took the lead of the colored people. They assisted Christophe to overthrow the bloody tyrant in 1806, but deserted Christophe when they saw that he wished to make himself sovereign. Péthion now established an independent republic in the western part of the island; and B. made himself indispensable to him by his military and administrative knowledge, so that he was invested by the new president with the command of the capital, Port-au-Prince, and the rank of a maj. gen. In this capacity he endeavored to discipline his troops after the European manner; drove back more than once the black hordes of Christophe, thereby preserving Port-au-Prince from destruction; was recommended to the people by Péthion, when dying, as most worthy to be his successor; and was unanimously elected president of the republic. He arranged the financial affairs, collected funds into the treasury, improved the administration, and encouraged arts and sciences. After the death of Christophe, he united the monarchical part of the island with the republic in 1820; and in 1821, the eastern district also, which had hitherto remained under the dominion of Spain; and he urgently sought the recognition of the independence of the youthful state by France, which was obtained in 1825, upon payment of an indemnity of 150 millions of francs. B. carried on the government of the republic of Hayti for fifteen years, from this time, with the most perfect peace; but his policy, which was rather arbitrary, and directed to the object of depressing the negroes in favor of his own race, the colored people, resulted in a victorious insurrection in 1843. B. fled to Jamaica, whence he announced his resignation to the Haytian revolutionary committee, and condemned himself to a voluntary ostracism. From the proclamation of the provisional government, it appeared that he was the victim of his aristocratic policy; but the provisional government, after it had obtained the upper hand, conducted itself very moderately towards the defeated party. See HAYTI. After a protracted stay in Jamaica, B. went to Paris, where he died in the beginning of July, 1850. He was a man of great perseverance, and of captivating manners, but artful, and often harsh and cruel to those under him.

BOYLE, a co. in central Kentucky; 180 sq.m.; pop.'80, 11,930—4,738 colored. The Louisville and Nashville railroad passes through the county. The soil is deep and fertile, producing cereals and root crops. Co. seat, Danville.

BOYLE, a t. in Roscommon co., in a picturesque valley on both sides of the Boyle, 1 m. above its expansion into lough Key, and 8 m. n.w. of Carrick-on-Shannon. Pop. '71, 3347. It has a large trade in corn and butter. Latin and English annals of B. date from 420 to 1245, and have been published. An abbey was built here in the 12th c., and was reduced to its present ruined state in 1595 by the earl of Tyrone.

BOYLE, CHARLES, third Earl of Orrery, was b. at Chelsea, Aug., 1676, and entered Christ Church, Oxford, in his 15th year, where he had for his tutors Drs. Atterbury and Friend. His attainments as an undergraduate were respectable for a nobleman, and probably this circumstance induced the master of the college, Dr. Aldrich, to select the youth for the annual task of editing a classic. In B.'s case, it unfortunately happened that the *Epistles of Phalaris* were chosen, sir William Temple having about that time passed the most extravagant encomiums upon them. In 1695 the work appeared. Two years later Bentley published his famous *Dissertation*, in which he proved that the Epistles, instead of being composed in the 6th c. B.C., were the production of the 2d c. after Christ. B., in reality, had little to do with the unlucky performance to which his name had been attached. It was the work chiefly of Atterbury and Friend. Nevertheless, in the following year, and while B. himself was absent from the country, the wits and scholars of Christ Church again exposed him and themselves to the merciless criticism of Bentley, by publishing *An Examination of the Dissertation, etc., by the Hon. Charles Boyle.* In 1699, Bentley once more replied, and sealed the lips of his adversaries forever. But for this *Battle of the Books*, in which he only seemed to be engaged, B.'s name would have been forgotten. In honor of him, the name of "Orrery" was given to the scientific apparatus of that name by its constructor, to whom B. had been kind. He fought as a maj.gen. at Malplaquet, was promoted to diplomatic and court appointments, wrote some literary pieces, and died in 1731. Of his poems, even sir Richard Blackmore said:

> After his foolish rhymes, both friends and foes
> Conclude they know *who did not write his prose.*

BOYLE, JOHN, Earl of Cork and Orrery. He was educated at Oxford, and devoted himself to literature, translating the letters of Pliny the younger, and writing a life of Swift in letters to his son. He published also the *Memoirs of Roland Carey, Earl of Monmouth*, and his own letters from Italy were published after his death.

BOYLE, RICHARD, the founder of the house of Cork and Orrery, and fitly styled the great earl of Cork, was b. in 1566, at Canterbury, of a good but not wealthy family. At the age of 22, after having studied at Cambridge and the middle temple, he went over to Ireland with a few pounds in his pocket, to hew his way to fortune. His energy, prudence, and signal capacity for government, received their reward. He bought estates and improved them, promoting the immigration of English Protestants, and triumphed over the envy of his enemies, making good his cause before queen Elizabeth, and winning her favor. Due honors flowed in upon him, and at length he was knighted. In 1620, he became viscount Dungarvan and earl of Cork. In 1631, he was made lord high treasurer, an office which remained hereditary in his family. In his old age, the Munster rebels compelled him to gird on armor and turn his castle into a fortress. He soon raised a little army of his servants and tenants, and with an auxiliary force commanded by his four sons (and paid, when his money was spent, out of his plate-chest), the noble old earl took castles, smote the rebels, and quenched rebellion in his borders. He died in 1644 at the age of 78.

BOYLE, the Hon. ROBERT, seventh son and fourteenth child of the first earl of Cork, was b. at Lismore, Waterford, Jan. 25, 1626. As a child, he was distinguished by precocity of intellect and a rare love of truth. After studying at Eton and at home, he went to the continent, where he stayed for six years. On his return in 1644, he found himself in possession, by his father's death, of the manor of Stalbridge, Dorsetshire, where he took up his abode and resided till 1650. He took no part in political strife, but devoted himself to the cultivation of science, and particularly of chemistry and natural philosophy. He was one of the first members of that association of scientific men which about that time, 1645, held private meetings at Oxford and London, and some years after became better known as the royal society. In 1654 he settled at Oxford. Here he experimented extensively in pneumatics, and improved the air-pump. At the same time, he devoted considerable study to theology. After the restoration, he was urgently advised by lord Clarendon to enter the church, but he thought that he could do better service to religion as a layman. Among the proofs which he gave of this, besides his own theological writings and eminent example, were his exertions as a director of the East India company for the propagation of Christianity in the east, as well as in procuring and circulating at his own expense translations of the Scriptures, and his bequest for the foundation of the "Boyle Lectures" (q.v.) in defense of Christianity. In 1668, he took up his residence permanently in London, and was thenceforth able to devote much of his time to the business of the royal society. In 1680 he was chosen president, but declined the honor. A peerage had repeatedly been offered to him, and declined. In 1688, finding his health decline, he shut himself up against all interruption, in order to husband his remaining time for the labor of repairing the loss caused by the accidental destruction of his MSS. In 1691, his health finally gave way, and on the 30th of Dec., 1692, he died, seven days after his beloved sister, lady Ranelagh. B. was tall and emaciated in person, and extremely temperate in his habits, often subject to low spirits, but naturally lively and of rare conversational powers. His piety, benevolence, and charity would have made him remarkable, apart from his scientific attainments and reputation. His complete works (including his very interesting correspondence), with a life by Dr. Birch, and an index, were published in 5 vols. fol. (Lond. 1744).

BOYLE, ROGER, Earl of Orrery, fifth son of the "great earl of Cork," 1621–79. He was made baron Broghill when only five years old; studied at Dublin college, traveled in France and Italy, and married Margaret Howard, sister of the earl of Suffolk. There was a rebellion spreading in Ireland, and B. started to get from Charles II. a commission to raise troops. At London he was confronted by Cromwell, then gen. of the parliamentary forces and one of the committee of state, who told him that the committee knew of his design, but B. declared the information false. Cromwell then produced B.'s private correspondence, and he was compelled to admit, and ask pardon, whereupon Cromwell offered him a command as general officer, exempt from all oaths and engagements, and added that he should not be compelled to draw his sword against any save Irish rebels. Thenceforth B. served the protector honorably and with effect, and Cromwell placed high confidence in him, making him one of his privy council. When the restoration came, it was found that B. had done much towards it, and the king made him earl of Orrery, and soon after one of the lords-justices of Ireland. In 1665, he went to England to settle a serious misunderstanding between Charles and the duke of York, and on his return he rendered abortive a scheme of the French and Dutch for a descent upon Ireland. He wrote several dramas and poems which have long been forgotten.

BOYLE LECTURES, so called from the founder, the honorable Robert Boyle (q.v.), who settled an annual salary, charged upon his dwelling-house in St. Michael's, Crooked lane, London, for "some preaching minister," who shall preach eight sermons in the year for proving the Christian religion against atheists, deists, pagans, Jews, and Mohammedans, not descending to any controversies among Christians themselves.

Archbishop Tennison procured a yearly salary of £50, to be charged upon a farm at Brill, Bucks, instead of the original charge for the endowment. The office is tenable for three years.

The first series of lectures, *A Confutation of Atheism*, was preached in 1692 by Richard Bentley (q.v.). In 1704, Dr. Samuel Clarke preached the lectures, entitled *A Demonstration of the Being and Attributes of God*, in answer to the arguments of Hobbes, Spinoza, and their followers. In 1709, Dr. Lilly Butler lectured on *Religion no Matter of Shame*. All the lectures preached up to 1732 were collected into a fine folio edition, in 3 vols. (Lond. 1739); since that period, till recently, few of the lectures have been published. In 1846, the course of lectures was preached by the Rev. F. D. Maurice, and published under the title, *The Religions of the World*. The more eminent lecturers of recent years whose courses have been published are: Merivale, the historian (1864–65), who lectured on *The Conversion of the Roman Empire and Northern Nations;* prof. Plumptre (1866); prof. Stanley Leathes (1868–70); and Dr. Hessey (1871–73).

BOYLE'S FUMING LIQUOR is the term applied to a concentrated solution of ammonia, saturated by a stream of hydrosulphuric acid, which combining with it, forms the sulphide of ammonium (NH_4S). Exposed to the air, it fumes, and evolves a very disagreeable odor, resembling, but in an intensified degree, ordinary bilge or sewerage water.

BOYLE'S LAW. See MARIOTTE'S LAW, *ante*.

BOYLSTON, ZABDIEL, 1680–1766; b. in Mass. When inoculation in cases of smallpox was first called to public attention in this country, B. was the earliest experimenter, all the other physicians rejecting the new notion. He tried it in his own family, and then among others; but the whole profession opposed him, and he came near being mobbed. Finally a number of eminent ministers came to the rescue, and he and inoculation were supported.

BOYNE, a river in the e. of Ireland, rises in the bog of Allen, and flows through Kildare, King's co., Meath, and Louth. It passes Trim, Navan, Slane, and Drogheda, and enters the Irish sea 4 m. below the last town, after a course of 65 m. in a carboniferous limestone basin, its total descent being 336 feet. Its chief tributaries are the Deel, Mattoch, and Blackwater. It is navigable for vessels of 250 tons to Drogheda, and for barges of 70 tons to Navan, 19 m. up. Its banks are studded with many ruins of monasteries and castles. In 838, Turgesius the Dane sailed up the B., and plundered Meath. But this river is chiefly famous for the battle of the Boyne, which took place on its banks, near Oldridge, on the 1st of July, 1690, and in which William III. defeated James II. An obelisk, 150 ft. high, marks the scene of the battle.

BOYNE, BATTLE OF THE, in Ireland, near the river Boyne, July 1, 1690 (in new style the 12th of July is the anniversary). This battle was fatal to the cause of James II., and assured the ascendency of Protestantism in England. The troops of James, 30,000 in number, were defeated with a loss of 1500, by the forces of William III. (James' son-in-law), who had about the same number of men, but lost only about 500. James fled to Dublin, thence to Waterford, and escaped to France. The duke of Schomberg, the leader of a contingent of French Protestants, while leading his troops across the river, was accidentally shot by one of his own men. In the same battle rev. George Walker, the Protestant leader who so long defended Londonderry, was killed. The battle is sadly remembered now, nearly 200 years after its occurrence, by all Irish Roman Catholics, and on the other hand is joyfully celebrated by Protestants of that nation, who parade on each anniversary, wearing orange colors in allusion to William III., prince of Orange. Even within a few years past the 12th of July has been marked in several American, Canadian, and Irish towns by deeds of violence arising from religious animosity. In New York, in response to the request of the authorities, the Orangemen have ceased their public parades, but celebrate the day by excursions, picnics, or in some other private manner.

BOYS, SHIPS'. In nautical language, all the young or green hands on board are called *boys*, without much reference to their age; but in recent times, arrangements have been made to give a more precise meaning to the term, by engaging boys or lads as part of the crew.

In the royal navy, boys were first voted for in the estimates in 1834. There were 1000 in that year; 7000 in 1876; 6300 in 1878; and 5300 in 1879. The admiralty has, in recent years, made many regulations for attracting boys into the navy. Most of the seamen at present in the service entered it as boys. They enter mostly at about 14 years of age, but some as late as 18, and they are bound for 7 years. There are schools established for them at Portsmouth, Plymouth, Cork, and one or two other places. The boys are ranked in two classes, according to age and experience. When out of their time, they have a tendency to enter the merchant service for two or three years; but they usually return to the navy, and enter as ordinary seamen. See further under MANNING THE NAVY.

In the merchant service, boys are apprenticed to the shipowners; they learn their duties by degrees; and constitute the source out of which mates, masters, and captains are ultimately supplied. By the merchant seamen's act of 1844, every merchant-ship was bound to take a certain number of boys as apprentices, according to tonnage; the

better hands were apprenticed by their friends; the worst were picked up by the marine society from the poor and wretched of the streets, and apprenticed as a means of setting them up in life. The indenture was from 12 to 18 months. The regulations have been modified in form, but not in substance, by the mercantile marine act of later date.

BOYSE, or BOIS, JOHN; one of the translators of the English Bible, 1560–1643. He could read Hebrew when only five years of age. At Cambridge he paid especial attention to Greek, and lectured on that language for ten years. While rector of Boxworth he was selected as one of the translators, and it is said did not only his own portion, but also that of another translator.

BOZRAH, or BOSTRA; the name of one or two places mentioned in the Bible—a city of Edom, and a city of Moab. The general opinion is that B. was on or near the present village of el-Buseirah, 25 m. s.e. of the Dead sea. B. is now a small village, with a strong fortress on the top of a hill, in a pastoral district, and inhabited by between 100 and 200 shepherds. The Moabite Bozrah is a vast collection of ruins, about 80 m. s. of Damascus. In 105 A.D., the city was restored and beautified by Trajan, who made it the capital of the province of Arabia. In the reign of Alexander Severus it was made a colony, and in 245 A.D., Philippus, a native of B., ascended the imperial throne. It appears to have been Christianized by Constantine, and was the see of an extensive bishopric. B. was one of the first Syrian cities subjected to the Mohammedans, and was held by them against all attempts of the crusaders at recapture. As late as the 14th c. it was a populous place.

BOZZARIS, MARCOS, a Greek patriot who distinguished himself in the early part of the modern war of independence, was b. at Suli, in the mountains of Epirus, towards the close of the 18th century. His youth was spent amid the din of arms. In 1803, he was forced to retreat to the Ionian isles by Ali Pasha (q.v.), who, in a series of bloody combats, had nearly exterminated the Suliotes. In 1820 two events occurred which called forth his patriotic energies: Hypsilanti summoned the Greeks to insurrection, and war broke out between Ali Pasha and the sultan. On learning the news, B. put himself at the head of some 800 expatriated Suliotes, and passed over into Epirus. Ali, who dexterously endeavored to identify his cause with that of the Greeks, soon found means to secure B.'s services against their common enemy, the sultan. B. obtained several victories, and on the death of Ali at the taking of Janina in 1822, he continued the war successfully against Khurshid Pasha, the Turkish general. Shortly after, prince Mavrocordato landed at Mesolonghi, with a body of disciplined troops, and being joined by B., he engaged the Turks at Petta, on the 16th of July, 1822. Through treachery the Greeks were overpowered, their best soldiers perished, and B., along with Mavrocordato, was compelled to retire to Mesolonghi. This place he skillfully defended against the Turks, until a Hydriote fleet forced them to retire. In the summer of 1823, a Turco-Albanian army of 20,000 men, under the command of the Pasha of Scodra, descended from the n. of Epirus. B., who knew that the fortifications of Mesolonghi were too weak to withstand an assault, determined to surprise his enemies by a sudden blow. He advanced swiftly at the head of 1200 men, and on the 20th of August reached Kerpenisi, where the van of the Turco-Albanian army, 4000 strong, was encamped. At night, the Suliotes burst in upon their startled foes, who were routed with great slaughter. The victors captured their camp, standards, and a vast quantity of baggage. This triumph was saddened by the loss of the heroic B., who fell while leading on his men to the final attack. His body was solemnly interred at Mesolonghi, and he was honored with the title of the "Leonidas of Modern Greece."

BOZZOLO, a t. of n. Italy, province of Mantua, situated on the right bank of the Oglio, about 16 m.w.s.w. of Mantua. B., which was at one time a small independent republic, has remains of old fortifications, some silk-weaving, and an annual fair. Pop. about 4500.

BRA, a t. in the province of Cuneo, n. Italy, 25 m. n.e. of Coni. It has metal foundries and silk manufactures, and a good trade in cattle, grain, and wine. Pop. 10,500.

BRABANCONNE, the patriotic song of the Belgians, originally sung by the insurgents during the revolution of Sept., 1830. A young French player, by name Jenneval, at that time connected with the theater at Brussels, was the author of the song; it was set to music by a singer named Campenhout. Jenneval fell in a combat with the Dutch at Berchem. The Belgians allowed his mother a pension of 2400 francs. Campenhout received from king Leopold a golden snuff-box, and was appointed director of the royal chapel. Each verse of the B. ends with the refrain—

La mitraille a brisé l'orange
Sur l'arbre de la liberté.

BRABANCONS, mercenary fighters from Brabant and other countries who, in the later middle ages, served any who would pay them. They were poorly organized and little better than banditti.

BRABANT was the name formerly given to an important province of the Low Countries, extending from the left bank of the Waal to the sources of the Dyle, and from the Maas and the plain of Limburg to the lower Scheldt. In the time of Cæsar,

B. was inhabited by a mixed race of Germans and Celts; it afterwards came into possession of the Franks; and in the middle ages it formed a duchy by itself, dependent upon Lower Lorraine, with which, in 1107, the county of Antwerp was incorporated, and in 1347, for a time, the lordship of Mechlin or Malines, formerly connected with Liège. After many changes, B. (divided into the provinces of North and South B.) was made a part of the kingdom of Holland, at the Congress of Vienna; but at the revolution of 1830, South B. separated from Holland, and became part of Belgium (q.v.). Old B. is now divided into three provinces: 1. North or Dutch B., containing 1960 sq. m., and (1875) 447,632 inhabitants; 2. The Belgian province of Antwerp, which contains 1094 sq. m., and (1873) 513,543 inhabitants; and 3. South B., also Belgian, containing 1260 sq. m., and an extremely dense pop. of (1873) 922,468. The country consists of a plain gently sloping to the n.w., and rising in the s. into gentle hills, which are offsets of those of the Ardennes. In the level northern part are many heathy and fenny tracts; one of them, a morass called the Peel, is 20 m. in length, and from 2 to 6 broad. In the hilly district of the s. is the forest of Soignies. The Maas and the Scheldt are the principal rivers; but some of their tributaries are also very useful for internal commerce, which is further promoted by canals and railways. The soil of North Brabant is fertile, and wheat, rye, oats, barley, beans, potatoes, beet, colza, madder, flax, and hay are extensively grown; also hops, tobacco, and chicory. Farm stock is large. Principal towns are: s'Hertogenbosch, Tilburg, Breda, and Bergen-op-zoom. Soap-boiling, distilling gin, book-printing, refining salt, making beet-sugar, beer, cigars, thread, woolen cloths, leather, earthenware, weaving and printing cottons, Turkey-red dyeing, are chief industries. B. lace has long been celebrated. The inhabitants in the n. are Dutch; in the middle district, Flemish; and in the s., of Walloon race. The boundary between the languages is a few leagues to the s. of Brussels, the Walloon French being spoken to the s., and Flemish and Dutch to the n. of this line.

BRACCIO, Fortebracci, Count of Montone, a celebrated condottiere (see Condottieri), born at Perugia in 1368, of an old patrician family, was, in early youth, the leader of a troop of mercenaries in the service of the count of Montefeltro, against the Malatesti, lords of Rimini. He became the champion of the Perugian nobles who were driven into exile in 1393; and after serving in Lombardy under Alberico da Barbiano, he carried on a partisan warfare in the marches of Ancona against the marquis Ludovico Migliorati, nephew of pope Innocent VII. In 1408, he entered the service of Ladislaus, king of Naples, who had designs on central Italy, and, with his condotta, crossed the Apennines, scoured the valley of the Tiber, and took several towns. In June of the same year, the people of Perugia offered the dominion of their city to the Neapolitan king on condition that he would prevent the nobles from returning. He accepted it, and ungenerously sent a large force against B., who retired to the marches. In 1416, however, B. obtained the sovereignty of his native city, when the banished nobles, after an exile of twenty-four years, were restored. In 1417, B. got possession of Rome by capitulation, but was soon obliged to evacuate it. He afterwards made terms with the pope (Martin V.), with whom he had a conference at Florence in Feb., 1420, and subsequently accepted from Joanna, queen of Naples, the command of her land-forces, with the rank of high constable of that kingdom. Entering the Abruzzo, he surprised Capua, and having relieved Naples, then besieged by the queen's enemies, was created by her count of Foggia and prince of Capua. In 1423, B. was, by her order, crowned at Perugia, as prince of Aquila and Capua. Aspiring to the throne of Naples, he overran Campania and Apulia with a considerable army, took Bari, and advanced into Calabria. In a battle which ensued for the relief of the strong town of Aquila, besieged by him, B. was wounded and taken prisoner. After lingering for three days, refusing food, he died June 5, 1424, in his 56th year. His deeds, in chronological order, and those of his contemporary, Piccinino, are commemorated by Lorenzo Spirito, in a poem of 101 chapters, in terza rima, entitled *L'Altro Marte* (Vicenza, 1489).

BRACE, in carpentry, an oblique piece of wood used to bind together the principal timbers of a roof or other wooden structure. See Roof, Boring.

BRACE, Charles Loring, b. Conn., 1826; graduate of Yale; studied in the union theological seminary; a recognized minister, but not in charge of any church. In 1850, in company with Frederick Law Olmstead he made a pedestrian tour in Great Britain; the next year went to Hungary, where he was arrested on suspicion of being one of Kossuth's agents, but was soon released. Afterwards he studied the school systems of Switzerland, England, and other countries. On his return in 1852, he became associated with Rev. Mr. Pease in the early operations of the "New York Children's Aid Society," which made an effort to transport to homes in the country some of the outcast and poor children of the city, and to give instruction and shelter to those who remained. The society at once took favor with the people; B. soon became and still remains the head and soul of it, and its operations have risen to national importance. Through its agency many thousands of unfortunate and neglected children have been made honorable men and women. B. visited Europe again, and the result of his observations is found in *Hungary in* 1851; *Home Life in Germany; Norse Folk; Races of the Old World*, etc. He has also published *The New West; Short Sermons for Newsboys; Dangerous Classes in New York*, etc.

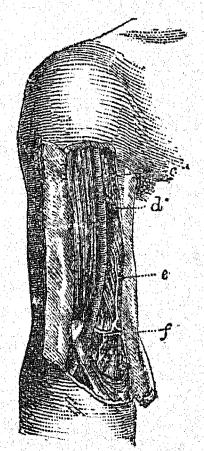
BRACE, JULIA, b. Conn., 1806; at the age of 4½ years she lost both hearing and sight, and quickly forgot the little she had learned of language. When 19 years old she entered the deaf and dumb asylum in Hartford, where she lived about 30 years, and then made her home with a relative, with whom she was living in Dec., 1879. She has a strong memory, and easily discriminates by feeling the articles belonging to different persons. She knows enough about time to reckon days and weeks, and always recognizes Sunday. Though she has not manifested a profound moral consciousness, she does not steal, nor does she commit any wrong act; being regardful of the rights of others, while she is careful also of her own.

BRACELET (Fr. *brachiale*, from Lat. *brachium*, the under part of the arm), an ornament worn on the arm, generally at the wrist. Bracelets and armlets (Lat. *armillæ*) have been used by every nation, both savage and civilized, from the earliest periods to our own. They are frequently mentioned in Genesis, as worn both by men (xxxviii. 18) and by women (xxiv. 30); both by the Hebrews and the surrounding nations (Numb. xxxi. 50). Similar ornaments were worn round the ankles, but they are stigmatized by Isaiah as marks of luxury (iii. 16). The Medes and Persians were remarkable, even amongst Asiatics, for their love for ornaments of this class. They wore not only bracelets and armlets, but ear-rings, collars, and necklaces, which often consisted of strings of valuable pearls, or were enriched with other jewels. These ornaments were used to indicate the rank of the wearer, and this use has continued to be made of them in the east down to the present day. In Europe, bracelets and armlets were worn both by the classical nations and barbarians from the earliest times. The Gauls wore them; and the Sabines, as early as the foundation of Rome, had ponderous golden armlets on the left arm. The same was the case with the Samians about the same period. It does not appear that armlets were worn by men during the historical period of Greece, but ladies wore both armlets and bracelets of the most various materials and forms. Both generally passed round the arm several times, and the form of B. now most in fashion has been accurately copied from those twisted spirals described by Homer in the eighteenth book of the *Iliad*, line 401. Many examples of this kind of B., as represented on painted vases, will be found in Sir William Hamilton's work. We are indebted to the Greeks even for the idea of giving to these spiral bracelets the form of a snake, the best models of our present goldsmiths being exact copies of antique bracelets. The goddesses of the Greeks, like the blessed Virgin in Roman Catholic countries, were represented as attired in the style of ladies of the highest rank; and the celebrated marble statue of Aphrodite, preserved at Florence, exhibits traces of a metallic armlet. Amongst the Romans, armlets were frequently conferred upon soldiers for deeds of valor, of which an instance is mentioned by Livy (x. 44). Roman ladies wore bracelets, not only for ornament, but also for the purpose of containing amulets, which were supposed to effect miraculous cures. On this principle it is said that the emperor Nero wore on his right arm the skin of a serpent, inclosed in a golden armilla. But at Rome also, it was chiefly as an indication of rank or wealth that these ornaments were worn.

BRACES, on shipboard, are ropes attached to the yard-arms, and employed to shift the sails in a horizontal direction round the masts, so as to receive advantageously the wind that may be blowing at any particular moment. The phrases, "to brace to," "to brace about," "to brace the yards sharp up," etc., apply to this operation.

BRACHE (Fr. *braque*, diminutive *brachet*), a term frequently employed by the older English authors to designate some kind of dog. To what kind this name belonged, is, however, not very certain. The probability appears to be, that it was applied to hounds or hunting-dogs in general. The term is believed to be of Celtic derivation (from *bracach*, grayish, badger-colored, or *breac*, spotted), and to have originally signified gray or spotted dog.

BRACHIAL ARTERY is that portion of the great arterial trunk supplying the upper extremity between the armpit and the elbow; in other words, it is the continuation downwards of the axillary artery. The B A. runs along the inner side of the arm, just behind the inner margin of the biceps muscle, and behind the great median nerve. Here it may be pressed against the bone, in cases of bleeding from any point below. In its course the B. A. gives off, 1*st*, the superior profunda branch, which winds round the back of the arm-bone, and re-appears on the outer side, where it joins some twigs coming up from the radial artery; 2*d*, an artery which enters the bone to supply its medullary membrane; 3*d*, the inferior profunda, which, running down behind the internal condyle (the funny bone) of the humerus, joins branches coming from the ulnar artery; 4*th*, a short branch, the anastomotica magna, which breaks up into numerous branches inosculating round the elbow.



Brachial Artery.
c, brachial artery; *d*, superior profunda branch; *e*, inferior profunda; *f*, anastomotica magna.

BRACHIO'PODA (Gr. arm-footed), or PAL'LIOBRANCHIA'TA (Gr. mantle-gilled), a class of molluscous animals, having bivalve shells, but differing in important points from the vast majority of recent mollusks with bivalve shells, the *lamellibranchiata* (q.v.). The chief differences existing in the shelly covering itself have been already pointed out in the article bivalve shells (q.v.), but those of internal structure are still more important. The mantle or *pallium* (see MOLLUSCA) in the B. consists of two broad expansions or lobes, covered by the two valves of the shell, and inclosing all the other soft parts of the animal; whilst respiration or the aëration of the blood is carried on by the surface of these lobes themselves, traversed by minutely ramifying blood-vessels, extended into processes, and furnished, especially along the edge, with vibratile cilia which create a continual current in the surrounding water, and thus keep up a fresh supply, from which the necessary air may be obtained. The organs by which food is procured are also remarkable—two long arms arising from the sides of the mouth, and disposed wholly or partly in spiral curves, when not extended to seek or seize prey. These arms are usually furnished with numerous vibratory filaments, which are supposed not only to aid in the capture of prey, but in the maintenance of the current necessary for respiration. The B. are attached to solid bodies either by a footstalk or by one of the valves of the shell. Of existing species, the *terebratulæ* or lamp-shells (q.v.) are by far the most numerous; but even these appear to have existed in far greater numbers in former geologic periods, and of some of the other families of B. only a single species is known to exist, or the existing species are very few, whilst the fossil species are very numerous. The existing species are very widely diffused over the globe. All of them are marine, and one (*crania personata*) has been brought up from the depth of 255 fathoms. The B. are regarded as exhibiting structural affinities not only to the *ascidia* (q.v.) and the *lamellibranchiata*, between which they are commonly placed, but also to the class *bryozoa* or *polyzoa* among *zoophytes* (q.v.).

BRACHISTOCHRONE, the curve of the quickest descent, or the curve which a falling object must make between two points which are not in the same vertical line, if it descended in the shortest possible time. The curve is the common cycloid.

BRACHYL'OGUS, the title of a work containing a systematic exposition of the Roman law, compiled probably in the 12th c., though some assign it to the reign of Justinian. The earliest extant edition was published at Lyons in 1549, under the title of *Corpus Legum per Modum Institutionum*, and the title *Brachylogus totius Julis Civites* first appears in an edition dated 1553. Its value is chiefly historical.

BRACHYP'TERÆ, or BRACHYP'TERES (Gr. short-winged), in ornithology, that section of the order of *palmipedes* (q.v.), or web-footed birds, in which the wings are short, and the feet are placed far back, so as to compel the birds to assume a nearly erect posture when on land. They are all very aquatic in their habits, and excel in diving, so that the name DIVERS is sometimes used as equivalent to B.; but that name is also not unfrequently applied to other aquatic birds, and is sometimes restricted to the genus *colymbus*. Auks, puffins, penguins, grebes, guillemots, and divers (*colymbus*) are among the brachypteræ.

BRACKEN, a co. in n.e. Kentucky, on the Ohio and Licking rivers; 200 sq.m.; pop. '80, 13,508—814 colored. Productions agricultural; co. seat, Augusta.

BRACKENRIDGE, HENRY M., 1786–1861; b. Penn., son of Hugh Henry. He was a lawyer of long practice in Maryland; district judge of Louisiana, in which position he was useful to the government in the war of 1812, of which war he wrote a history. He advocated the acknowledgment of the independence of South American states, and his pamphlet on the subject was deemed of sufficient importance to receive an official answer from the Spanish minister at Washington. Subsequently he was commissioner to the new republics, and in return published *A Voyage to South America*. He was judge of the w. district of Florida for ten years; then removed to Petersburg, where he was chosen to congress. In 1841, he was commissioner under the treaty with Mexico. Besides many essays on various subjects, he published in 1859, in defense of his father, a *History of the Whisky Insurrection*.

BRACKENRIDGE, HUGH HENRY, 1748–1816; b. Scotland; a jurist and author; graduate at Princeton, N. J.; chaplain in the continental army; prepared to practice law; edited the *United States Magazine* of Philadelphia; began law practice at Pittsburgh; in 1799 appointed judge of the Pennsylvania supreme court, and held the office until his death. He was concerned in the "Whisky Insurrection" in 1794, and published a defense of his course. He wrote much in verse, the most popular being, *Modern Chivalry, or the Adventures of Capt. Farago*, a humorous burlesque.

BRACKET, an ornamental projection from a wall, used for the purpose of supporting a statue, bust, or the like. See CORBEL. Brackets may be either of stone or wood, and they are sometimes elaborately designed and carved. The term B. is also employed in joinery, etc., to designate supports, in the form of a bent knee, of shelves, galleries, etc. B. is also generally applied to such gaslights as project from the wall.

BRACKETT, EDWIN E., b. Maine, 1819; a sculptor of eminence, known mainly by his busts of American celebrities: Washington Allston, Richard H. Dana, Bryant,

Choate, Longfellow, Sumner, Garrison, John Brown, Benjamin F. Butler, Wendell Phillips, and others.

BRACKETT, WALTER M., brother of Edwin E., b. Maine, 1823; noted as a painter of game fish.

BRACKLESHAM BEDS, a group of highly fossiliferous strata in the middle eocene formation, included in the Bagshot series (q.v.).

BRACT, or BRAC'TEA, in botany, a leaf from the axil of which a flower or a floral axis is produced, instead of an ordinary leaf-bud or branch. Bracts are sometimes called floral leaves. The term B. is not, however, generally employed when, as is often the case, there is no marked difference from the ordinary leaves of the plant; but the flowers are said to be axillary, or in the axils of the leaves. On the other hand, the term B. is very frequently applied to all altered leaves interposed between the ordinary leaves and the flower or flowers. In this case, they are sometimes very small and scale-like. The ordinary leaves often pass, by imperceptible gradations, into bracts, diminishing in size becoming more simple, and often scariose. Bracts are generally entire, even when the ordinary leaves are divided. They are sometimes colored so as apparently to form part of the flower, and sometimes crowded, so as to resemble an involucre or an outer calyx. They appear to serve purposes analogous to those of leaves, or, when colored, of petals. When the primary floral axis is branched, bracts (sometimes distinguished as *racteolbes* or *bractlets*) are often to be seen at its ramifications. Bracts sometimes fall off at an early stage, sometimes they are more permanent, and sometimes they even remain to cover and protect the fruit.

BRACTON, HENRY DE, an English ecclesiastic and chief justiciary in the reign of Henry III. He took the degree of doctor of laws at Oxford, and was itinerant justice for Nottingham and Derby counties in 1245. In 1265, he was appointed chief justiciary. He wrote a comprehensive and systematic work on the laws of England, modeled after the "Institutes" of Justinian.

BRADBURN, SAMUEL, 1751–1815; b. Gibraltar; son of an English soldier; became a Wesleyan local preacher in England in 1773, and the next year an itinerant. He was one of the natural orators of early Methodism, endowed with ready wit and pathos. In 1799 he was president of the Wesleyan conference. After his death his *Sermons on Particular Occasions* were published.

BRADBURY, WILLIAM B., 1816–68; b. Maine; a composer of sacred music, and author in whole or in part of many books for Sunday-schools and choirs, among which are *The Shawm; The Jubilee; The Temple Choir; The Golden Choir; Fresh Laurels,* etc. His works have had much popularity.

BRADDOCK, EDWARD, a British maj.gen., commander against the French in America in 1755, arrived in Feb. of that year at Richmond, Va., and with a force of 2000, British and provincial troops, reached the Monongahela, a branch of the Ohio, on July 8. Leaving the baggage behind, on the 9th, his force moved forward to invest Fort du Quesne, now Pittsburg, Penn., when, from his slighting the warning of his American officers, of the probability of a surprise, the troops, in passing through a deep forest ravine, fell into an ambuscade of Indians, while they were attacked in front by the French, and half of them slain. The rest made a hasty retreat under col., afterwards gen. Washington, B.'s aide-de-camp, the only one of his officers who escaped with life. B., mortally wounded, was carried on a tumbril 40 m. to where the baggage had been left, and there he died.

BRADDON, Miss MARY ELIZABETH, one of the most popular novelists of the day, was born in London in the year 1837. Her father, Mr. Henry Braddon, was a solicitor. She very early showed a turn for literature, which she indulged in the usual manner, by sending verses and other trifles to the magazines and newspapers. In 1860, she essayed a somewhat more sustained effort in a little *commedietta* called *The Loves of Arcadia,* which was brought out at the Strand theater; and the year after, she published a volume of verse entitled *Garibaldi and other Poems.* Neither these, however, nor the tales which she now began to issue through the medium of the *Temple Bar* and *St. James's Magazine* —*Lady Lisle, The Captain of the Vulture, Ralph the Bailiff,* etc.—in any decisive way succeeded in drawing to her the attention of the public. Her first great success came with the publication, in 1862, of *Lady Audley's Secret,* which instantly attained a great popularity. This has since been extended by the appearance of *Aurora Floyd, Eleanor's Victory; John Marchmont's Legacy; The Trail of the Serpent; The Ladies' Mile; Sir Jasper's Tenant; Only a Clod; The Doctor's Wife; Run to Earth; The Lovels of Arden; Birds of Prey; Dead Sea Fruit; To the Bitter End; Strangers and Pilgrims; Weavers and Weft; The Cloven Foot* (1879), etc. Miss B. has contributed very extensively to *Belgravia,* a London magazine which she conducts. Few books of the period have secured a wider circle of readers than Miss Braddon's. They mainly depend for their interest on good bold effects of what is termed, in the slang of the day, *sensation,* and the art of their appeal to "that low vice, curiosity," in the conduct of a story, carefully leading up to some suspended and unforeseen *dénouement.* In their particular way, though without much claim to attention as regards either character or sentiment, they display undoubted talent: in style, they are fresh and vigorous, and their narrative power strongly excites the reader's interest. Miss B. is still in uninterrupted literary activity.

BRADFORD, a co. in n.e. Florida, on the Santa Fe river; intersected by the Atlantic and Gulf, and the West India Transit railroads; 940 sq.m.; pop. '70, 3691—824 colored. Productions, corn, cotton, sweet potatoes, and molasses. Co. seat, Lake Butler.

BRADFORD, a co. in n.e. Pennsylvania, bordering on New York; 1170 sq.m.; pop. '70, 53,204; in '80, 58, 534. Besides short railroads to its mines, the Northern Central and Lehigh Valley railroads traverse it. The rivers are the Susquehanna, the Towanda, the Wyalusing, and Sugar Creek. The surface is hilly, and thickly wooded. Iron, coal, and sandstone are abundant. The main article of export is lumber, but agriculture is the chief occupation. Co. seat, Towanda, 77 m. from Pittston.

BRADFORD, a t. in Essex co., Mass., on the Merrimac river, at the junction of the Boston and Maine and Newburyport railroads. A bridge connects B. with Haverhill. The B. academy for young ladies is an old and celebrated institution, affording a high grade of instruction. Shoe manufacturing is the leading business. Pop. '80, 2,643.

BRADFORD, an important manufacturing town in West Riding, Yorkshire, on a tributary of the Aire, at the meeting of three vales, 8 m. w. of Leeds. Pop. in '71, 145,827; of whom considerably more than one half are immigrants from other districts. The area of the parish is 34,146 acres, extending to the confines of Lancashire. It returns two members to parliament, having been created a parliamentary borough in 1832. It became a municipal borough in 1847. B. is the chief seat in England of the spinning and weaving of worsted yarn, and the great mart for the long wools used in worsted fabrics. Cottons are also manufactured. There are more than 200 mills, employing 40,000 persons. Notwithstanding the large population, and the nature of their employment, the annual rate of mortality is now only 24 per 1000. Twenty years ago, the rate was 30. The Saltaire alpaca and mohair mills, on the Aire, 3 m. from B., cover more than 6 acres. This establishment, erected by Sir Titus Salt, bart., is the most splendid manufacturing concern in England. Here is also the largest silk-mill in England, built by Mr. S. C. Lister. Coal and iron mines occur near Bradford. There are over 20 churches belonging to the establishment in the borough, and many dissenting and Roman Catholic churches. The gross estimated rental of the borough is £600,000, and the ratable value £500,000. It has two public parks, each containing more than 50 acres, besides smaller ones, and also many excellent charities. The Romans seem to have worked iron mines here, Roman coins having been found in foundry refuse near the town. The early history of B. is connected with the castle of the Laceys here. In the civil wars, the people of B. took the parliament side, and twice defeated the royalists, but were afterwards themselves defeated by the earl of Newcastle. In a riot at B., against the introduction of worsted power-looms, in 1826, two of the rioters were shot dead by the defenders of the mill which contained the obnoxious machinery, and many more were wounded. In 1825, a strike for increased wages, in which 20,000 persons were concerned, lasted six months. The Baptists, Independents, and Wesleyans have colleges near Bradford. This town is the seat of the first English temperance society. At Fulneck, 3 m. e. of B., is a Moravian settlement, founded in 1748, where Montgomery the poet was educated. B. has been latterly much improved in its buildings, and possesses a spacious and elegant public hall, in which the national association for promoting social science met in 1859, and the British association in 1873. The merchants of B. are distinguished by their liberality and enterprise. Their warehouses form the great wholesale market in the worsted and alpaca trade.

BRADFORD, ANDREW, 1686–1742; b. Philadelphia; son of William (the printer). He was the only printer in Pennsylvania from 1712 to 1723. On Dec. 22, 1719, he started the third newspaper in the colonies, and the first in Philadelphia, called *The American Weekly Mercury.* He kept a bookstore, and was for a time postmaster of the city. He was the first printer in Philadelphia to employ Benjamin Franklin as a typesetter.

BRADFORD, JOHN, an English minister; b. early in the reign of Henry VIII. He was secretary to the paymaster of the English forces in France, and used money not his own, but made restitution and resigned his place. He then studied divinity, and bishop Ridley of London appointed him his chaplain. B. was also chaplain to Edward VI., and one of the most popular preachers in the kingdom. When Mary came to the throne he was accused of sedition and sent to the Tower, and finally tried before Gardiner, where he defended his principles to the last. He was condemned, and burnt at the stake in Smithfield, July 1, 1555. Many of his short works are found in the issues of tract societies.

BRADFORD, WILLIAM, 1588–1657; b. England; one of the pilgrims, and second governor of Plymouth colony. He sailed from Leyden, Holland, in the *Mayflower.* One of his first acts, as the successor of gov. Carver, was to confirm the treaty with Massasoit, just in time to suppress a dangerous Indian conspiracy. Bradford's name is in the second patent, which conferred upon him, his "heirs, associates, and assigns," the territory named. He was governor, with some brief interruptions, for 31 years, but declined to serve further. B. was the author of a *History of Plymouth Colony* from 1602 to 1647.

BRADFORD, WILLIAM, 1658–1752; b. England; one of the Quakers who came to Pennsylvania in 1682, landing in the woods where Philadelphia now stands. He was

the first printer in Pennsylvania, printing an almanac in 1686. Having become obnoxious to some of the leading settlers for printing so-called seditious writings (for which offense he was tried but not convicted), he settled in New York in 1693, and there printed the laws of the colony. Oct. 16, 1725, he began the first newspaper in that city, *The New York Gazette*. Three years later he set up a paper mill at Elizabeth, N. J. For 30 years he was the only printer in the colony of New York. His body lies in Trinity church-yard.

BRADFORD, WILLIAM, 1755–95; b. Philadelphia; a lawyer, graduated at Princeton. He served as an officer in the revolutionary army, and was appointed attorney-general by president Washington.

BRADFORD, WILLIAM, an American painter, b. of Quaker parents in 1827, at New Bedford, Mass. He was educated for business, and for a while engaged in it at Fairhaven, Mass., but afterwards developed a talent for painting, especially in subjects relating to ships, the sea, and the shore. He made several voyages along the coast of New England and northward as far as Greenland. These furnished him with suggestions for some of his best pictures, among which are "A Stiff Breeze in the Harbor of Eastport," "A Squall in the Bay of Fundy," "The Coast of Labrador," and "Crushed by Icebergs."

BRADFORD CLAY, a member of the lower oolite, is a blue unctuous clay, occurring at Bradford near Bath, and extending for a few miles around: it is never more than 40 or 50 ft. in thickness. It is remarkable for the occurrence in it of large numbers of a crinoid (q.v.), (*apiocrinites Parkinsoni*). The upper surface of the calcareous rock on which the clay rests is completely incrusted over with a continuous pavement formed of the stony bases of this crinoid. It had once formed the bottom of a sea, in which these animals lived, their stems bending with every motion of the water, and their star-like crown of arms outstretched in search of food. At length, however, the clear water was invaded by a current largely charged with mud, which threw them down, and broke most of their stems off near the base. The stem, body, and arms have been dismembered, and are confusedly scattered through the clay.

BRADFORD, GREAT (Sax. *Bradanford*, broad ford), a t. in the co. of Wilts, on both sides of the Avon, and on the Kennet and Avon canal, 6 m. e.s.e. of Bath. Pop. '71, 4871. It has been noted for many centuries for its manufacture of fine broadcloths. Kerseymeres were first made here. An India-rubber manufactory has been also lately established. The remains of a monastery, founded in the 7th c. by St. Aldhelm, are still visible.

BRADLAUGH, CHARLES, b. 1833; an English atheist and sympathizer with radical revolutions; the editor of a paper devoted to reform. In 1873, he made a short visit to the United States, lecturing in the larger cities. In 1880, he was elected to parliament by a vote combined of various elements on the "liberal" side, though that party cannot be considered as favoring his extreme views. The tories made strong opposition to his admission to the house, partly because he declined to take the usual oath, although he was willing to affirm. A long debate ensued in which Bradlaugh's atheism was held up as a reason for non-admission; but finally, on motion of Gladstone, he was permitted to affirm and take his seat.

BRADLEY, a co. in s. Arkansas, on Saline river; 958 sq.m.; pop.'80, 6,285—2,211 colored. The surface is level; productions, corn, cotton, sweet potatoes, etc. Co. seat, Warren.

BRADLEY, a co. in s.e. Tennessee, on the Georgia border, 400 sq.m.; pop. '70, 11,652—1,700 colored. The East Tennessee, Virginia, and Georgia railroad and Dalton branch pass through the county. It has an uneven surface, mountainous in some parts. Productions mainly agricultural. Co. seat, Cleveland.

BRADLEY, EDWARD, b. 1827; an English novelist, more generally known by his *nom de plume* of "Cuthbert Bede." He was educated at Durham university and took holy orders, but has devoted his attention almost entirely to literature. *Verdant Green* is one of the best known of his stories.

BRADLEY, Dr. JAMES, one of the most distinguished astronomers and discoverers of any time or country, was b. at Sherborne, in Gloucestershire, in 1692. He received his early education at a boarding-school at North Leach, whence, being destined for the church, he proceeded to Oxford. Soon after graduating, he obtained successively the livings of Bridslow and of Welfrie, in Pembrokeshire; but there is reason to fear that his mathematical pursuits considerably distracted his attention from his clerical duties. Devoting himself to mathematics and astronomy, he soon exhibited such a genius for these pursuits as to win the friendship of all the leading mathematicians of his time, among others, of the great Isaac Newton, and to get elected a member of the royal society. About the time of his election, 1721, he became, in his 29th year, Savilian professor of astronomy at Oxford, resigned his livings, and devoted himself wholly to science. In 1727, he published his theory of the aberration of the fixed stars, containing the important discovery of the aberration of light, to which, it is related, he was led somewhat by accident, as sir Isaac Newton was to the theory of gravitation.

What suggested this discovery to B., it is said, was the observation that the vane of a yacht in which he was sailing never lay in the line of the wind, but was always inclined to it at an angle depending on the line and amount of the yacht's motion. This led him to a train of thought resulting in the proposition, that the direction in which we see a star is not that in which it actually lies, but inclined to it by an angle depending on the direction of the earth's motion round the sun at the time of the observation, and the ratio of its velocity to that of light. See ABBERRATION. Three years after this publication, B. became lecturer on astronomy and physics at the Oxford museum. His next discovery was that the inclination of the earth's axis to the ecliptic is not constant, a fact including the explanation of the procession of the equinoxes and the nutation of the earth's axis. This discovery constitutes a great epoch in astronomy. Latterly, B. became regius professor of astronomy at Greenwich, where, by his observations, he still further enriched the science. He declined the living of the parish of Greenwich, which was offered to him, and was favored by the crown with a pension of £250 a year for his services to commerce and navigation. Towards the end of his life, B. was elected member successively of almost all the leading scientific societies in Europe. He died on the 2d of July, 1762, in his 70th year. B. is described as having been gentle, modest, compassionate, and liberal; little given to speaking or writing, from diffidence and the fear of hurting his reputation. No man ever better merited the title of a great astronomer.

BRADLEY, JOSEPH P., LL.D., b. N. Y., 1813; graduated at Rutgers college, and practised law in Newark, N. J. In 1870 he was appointed one of the justices of the U. S. Supreme court. He was a member of the electoral commission of 1877.

BRADSHAW, HENRY, an English poet of the 15th century. He was one of the Benedictine monks of St. Werberg in Chester. His works are *De Antiquitate et magnificentia Urbis Cestris, Chronicon;* and *Life of the Glorious Virgin St. Werberg.* They are now very rare.

BRADSHAW, JOHN, an eminent Puritan, was b. in 1586, of a good family in Cheshire, and studied law at Gray's inn. Called to the bar, he gained a good practice by his ability and learning, especially as a chamber council. In Oct., 1646, he was appointed a commissioner of the great seal, and in Feb., 1647, chief-justice of Chester. In Oct., 1648, he received the degree of sergeant, and in the following Jan., was elected president of the high court of justice for the trial of king Charles I. As the reward of his services on that solemn occasion, he was made president of the council of state, and chancellor of the duchy of Lancaster, besides the grant of estates worth £4000 per annum, the deanery house of Westminster for a residence, and £5000 to furnish it. B., however, refused submission to the Protector. He was an able lawyer, but not an able politician. His mind was rigid rather than broad, and, in consequence, he was unable (like so many others of the stern fanatical republicans of his time) to see or comprehend the necessity for a great iron rule like Cromwell's. He even engaged in some fifth-monarchy and other plots against Cromwell, but his respectable character and past services saved him from molestation. He was deprived, however, of his office as chief-justice of Chester. After Oliver's death, he was lord president of the council of state, and a commissioner of the great seal under Richard. His last public act was to protest against the violent seizure of speaker Lenthall by the army. He died Nov. 22, 1659. His body was buried with pomp in Westminster abbey, but it was afterwards exhumed and hung on a gibbet, with those of Cromwell and Ireton.

BRADSHAW'S RAILWAY GUIDE, the pioneer, and still the type, of that now extensive class of publications whose object is to convey all necessary information in regard to traveling. It derives its name from George Bradshaw, originally an engraver and printer in Manchester, who, in 1839, issued an occasional work called the *Railway Companion,* which was corrected by means of another work, in the form of a broad sheet, styled the *Monthly Time Tables.* This sheet was frequently delayed to the 5th or 6th of the month, and was subject to changes made by the companies, perhaps in the middle, or even the latter end of the month. By great efforts, the railway companies were induced to consent to adjust their tables, once for all, for the beginning of each month; and Mr. Bradshaw having established an agency in London, the first number of the monthly *Railway Guide* was brought out in Dec., 1841. The second number now before us, published "1st month (Jan.), 1842," runs to 32 pages, and contains 42 or 43 lines of railway, in England only, without any advertisements. Through the suggestions and exertions of Mr. W. J. Adams, the London agent and publisher, the plan was gradually enlarged and perfected, and resulted in the *Railway and Steam-navigation Guide* for Great Britain and Ireland, so well known to the public. The *Guide* now extends to upwards of 450 pages, which comprise the needful knowledge regarding all lines and branches in the three kingdoms; besides copious steamboat information; full details regarding coaching in Scotland; and numerous advertisements—price 6*d.* The information is obtained from the companies, at the last moment, in time to appear on the 1st of the month. The *Guide* has attained an immense circulation, and given birth to many publications of a similar character. Its plan has been imitated in France and Germany, in America, and even at the antipodes, where a *Bradshaw* is published at Sydney; and

in spite of many rivals, the original work has always maintained its place in general estimation.

In 1847, the first number of *Bradshaw's Continental Railway Guide* was issued, which has prospered no less than the British *Guide*. In addition to the tables, as furnished by the companies abroad, it contains a large quantity of topographical information. A series of *handbooks* was also projected by Mr. Bradshaw, which includes Great Britain, France, Switzerland, etc., but is still incomplete. The handbooks of the *Overland Journey*, and to the *Presidencies of India*, were published after Mr. Bradshaw's death, which occurred in 1853.

BRADSTREET, ANNE, b. England, 1612; daughter of gov. Thomas Dudley, of Massachusetts; married to Simon B., who also became governor. She was the earliest writer of verse in America, her first volume being published (in England) in 1690, under the title, *The Tenth Muse, lately sprung up in America*, containing "A Complete Discourse and Description of the Four Elements, Constitution, Ages of Man, Seasons of the Year, together with an Exact Epitome of the Four Monarchies, viz., the Assyrian, Persian, Grecian, Roman;" also a dialogue on politics between old and new England, "with divers other pleasant and serious poems." Several editions of her works have been published. She died in 1872.

BRADSTREET, JOHN, 1711–74; an English officer who spent nearly his whole life in service in the American colonies. In 1746, he was governor of St. John's, Newfoundland. He served in the French war, was in the attack on Ticonderoga in 1758, and soon afterward surprised and captured fort Frontenac. He served with Amherst in the Ticonderoga expedition of 1759, and against the Indians in the west, making a treaty with them at Detroit in 1764. In 1772, he was made maj.gen.

BRADSTREET, SIMON, 1603–97; b. England, steward to the countess of Warwick; married Anne (the poetess), daughter of Thomas Dudley, and was one of the earliest in founding a colony in Massachusetts. In 1630, he arrived at Salem, vested with the office of assistant judge; was secretary, agent, and commissioner of the united colonies, and in 1662 was sent to congratulate Charles II. on his restoration. From 1630 to 1679 he was assistant governor; 1673–79, deputy governor; and 1679–86, governor, until the charter was revoked. He was restored to office in 1689 and remained in power until the new charter arrived in 1692, when he was made first councilor.

BRADWARDIN, or BREDWARDINE, THOMAS; b. near the close of the 13th c.; archbishop of Canterbury. He was educated at Oxford, and became chancellor of the university and professor of divinity. He was chaplain and confessor to Edward III., whom he attended during his wars in France. He died of plague at Lambeth, 40 days after his consecration as archbishop, in 1349. His principal work is a treatise against the Pelagians. He wrote also on arithmetic, geometry, the quadrature of the circle, and proportion of numbers.

BRADY, HUGH, 1768–1851; an American officer who served under Wayne, and with distinction in the battle of Chippewa in 1812.

BRADY, JAMES TOPHAM, 1815–69; b. New York; a lawyer, educated by his father, who was also a lawyer and a judge. The son became eminent for eloquence, and for almost unbroken success in the cases undertaken by him. In New York he was popular both as a lawyer and a citizen, and especially admired as an off-hand speaker. He contributed largely to newspapers and magazines, but left no collected works.

BRADY, NICHOLAS, D.D., b. Ireland, 1659; with Nahum Tate he made a metrical version of the Psalms of David, and also translated Virgil's *Æneid*. He was a promoter of the revolution, but when the troubles broke out in Ireland in 1690, by his personal influence he thrice prevented the burning of his native town of Bandon, which James II. ordered should be destroyed. He died in 1726.

BRADY, WILLIAM MAZIERE, D.D., b. Ireland, 1825; graduate of Trinity college, Dublin; one of the leaders in the movement for the disestablishment of the Irish church, and the author of works on the ecclesiastical history and antiquities of Great Britain and Ireland.

BRADYPUS. See SLOTH.

BRAEMAR, (including the united parishes of Braemar and Crathie), an extensive Highland district, occupying the s.w. corner of Aberdeenshire, in the heart of the Grampian mauntains, and intersected by the upper part of the Dee and its tributaries. The chief mountains are Ben Macdhui (q.v.); Cairntoul, 4220 ft.; Braeriach, 4225; Ben-a-Buird, 3851; and Ben Avon, 3826, on the n.; and Lochnagar (q.v.), on the south. Patches of snow lie on these mountains all the year round. The rocks of B. are granite, gneiss, and quartz, with beds of primary limestone, and masses of serpentine, trap, and porphyry. Most of the district is uncultivated, and consists of healthy tracts, while about a twentieth of the surface is in wood. The natural woods are birch, alder, poplar, and rowan, and the planted chiefly larch and Scotch fir. The fir-timber of the ancient Caledonian forest of Mar, now nearly all cut down, is, for size and quality, the best in the kingdom. Red-deer, roes, grouse, ptarmigan, and alpine hares abound. Many rare alpine plants are found on the mountains and in the glens. Black-faced sheep and small black-horned

cattle are reared. Here the earl of Mar first raised his standard for the pretender in Sept., 1715. The district is intersected by the great military road from Blairgowrie to Fort George, made by gen. Wade. In the e. part of the district is Balmoral (q.v.); and near its center is the small village of Castleton of B., a favorite resort for travelers, sportsmen, and lovers of grand scenery. Pop. '71, 1566, many of whom still speak Gaelic.

BRAG, a game at cards, usually played by from four to eight persons. The whole pack is used, and the cards rank as at whist except the nines and knaves, which are called "braggers," and rank the same as any cards with which they may be held. An ace and a nine and a knave are called three aces, and a deuce and two brag cards make three deuces, etc. The highest hand is a pair royal, three of a kind, ace being highest; next best, highest pair, and last the single card. There is no playing, the hands are merely shown, and the highest wins the stake.

BRA'GA, a city of Portugal, capital of the province of Minho, is situated on an eminence between the rivers Cavado and D'Este, about 35 m. n.e. of Oporto. The neighborhood is charming, especially along the banks of the river Cavado. B. is surrounded by old walls, flanked with towers, and defended by a castle. It is the residence of the primate of Portugal, who has a palace here. It has also a fine Gothic cathedral, several spacious squares; and manufactures of linen, hats, cutlery, fire-arms, jewelry, etc. Pop. 19,514. It is a very ancient place, being supposed to owe its origin to the Carthaginians. In the time of the Romans, the city was named *Bracara Augusta*, and the ruins of a temple, an amphitheater, and an aqueduct, belonging to that era, still remain. Not far from B. stands the celebrated *Sanctuario do bom Jesus do Monte*, which is still a place of pilgrimage. After the Suevi had taken Lusitania from the Romans, B. was made the metropolis; and here, at a council held in 563 A.D., the Suevi, with their king, renounced the errors of Arianism, and submitted to the teaching of the Roman Catholic church. After the fall of the Suevian and West-Gothic kingdom, B. fell into the hands of the Arabs, from whom it was taken by the forces of Old Castile in 1040. After the establishment of the Portuguese dynasty, it was annexed to the crown of Portugal.

BRAGAN'CA, the name of two considerable towns in Brazil.—1. B., a seaport of about 6000 inhabitants, at the mouth of the Caite, which enters the Atlantic about 100 m. to the e.s.e. of the Amazon.—2. B., an island city of about 10,000 inhabitants, 50 m. to the n.e. of San Paulo, and about 200 to the w. of Rio de Janeiro.—The first is about a degree to the s. of the equator, and the second about a degree to the n. of the tropic of capricorn.

BRAGAN'ZA, or BRAGANÇA, a city of Portugal, capital of the province Tras-os-Montes, is situated in a pleasant and fertile district, on the river Fervença, an affluent of the Sabor. The city is surrounded with walls; has two castles, partly in ruins, of which one was the ancestral seat of the dukes of Braganza; and has manufactures of silk and velvet. Pop. 5000. This city gives its name to the house of Braganza, the present ruling dynasty in Portugal, John, eighth duke of Braganza, having ascended the throne as John IV., when the Portuguese liberated themselves from the Spanish yoke in 1640. See PORTUGAL.

BRAGANZA, HOUSE OF, the title of the family reigning in Portugal, so named from the old dukes of Braganza. The first duke was a bastard son of king John I. After the death of Sebastian without issue the people, who were forbidden by the constitution of 1139 to accept a foreign prince, took up with the Braganzas; but the Spanish kings ruled Portugal by force until 1640, when Don John, duke of Braganza, was made king with the title of John IV. and the family has ruled ever since.

BRAGG, BRAXTON, b. N. C., 1815; a graduate of West Point; served in the Florida war, and in the Mexican war, where his bravery at Fort Brown, Monterey, and elsewhere, was conspicous. His conduct at Buena Vista secured him his brevet as lieut. col. He resigned from the army in 1856. When the civil war broke out he joined the confederates, and in a short time was made general, succeeding Albert Sydney Johnson, who was at killed Shiloh. He met with several reverses, was defeated by gen. Grant at Chattanooga, and soon afterward was relieved from command.

BRAGI, son of Odin and Frigga, in the Norse or Scandinavian mythology, was the god of poetry and eloquence. Upon his tongue were engraved the runes of speech, so that it was impossible for him to utter a sentence that did not contain wisdom. According to the older or poetic Edda, he was the most perfect of all scalds or poets, and the inventor of poetry, which is designated by a kindred word, *bragr*. Unlike Apollo, who, in the Greek mythology, is represented as enjoying eternal youth, B. was supposed to be an old man with a long flowing beard; but his brow was always mild and unwrinkled. B.'s wife was Idunna. Together with Hermothr or Hermode, he received and welcomed all those heroes who had fallen in battle, on their arrival in Valhalla. On festive occasions, as well as on the burial of a king, a goblet, called Bragafull (B.'s goblet), was presented, before which each man rose up, made a solemn vow, and emptied it.

Several German periodicals and works, intended to cherish a national spirit, have taken the name of Bragi.

BRAHAM, JOHN, a celebrated tenor-singer, of Jewish origin, was b. in London in 1777, and d. Feb. 15, 1856. He had an unusually long professional career, having sung on the stage at the age of ten, and continued to make occasional appearances at concerts until within a few years of his death. About the close of the 18th c. he visited France and Italy for improvement; returning to London, his triumph was transcendent, and from that time, for half a century he held the reputation of one of the greatest tenor-singers in Europe. It was as a concert-singer that he excelled most, and his great declamatory power and florid execution made his singing of the national songs wonderfully effective.

BRAHE, TYCHO, one of the most distinguished names for which astronomical science can boast, was born at Knudsthorp (a place near the Baltic), in Denmark, in 1546. He was descended from a noble family, originally Swedish, and sent, at the age of 13, to the university of Copenhagen, where he had not been more than a year when an eclipse of the sun turned his attention to astronomy. His uncle, who destined him for the law, furnished him with a tutor, and sent him to Leipsic in 1562; but B., who cared nothing for that study, devoted just so much time to it as would save appearances, and while his tutor slept, busied himself nightly with the stars. By these surreptitious observations of the heavens, and with no other mechanical contrivances than a globe about the size of an orange, and a pair of rude compasses, he succeeded, as early as 1563, in detecting grave errors in the Alphonsine and Prutenic tables, and set about their correction. The death of an uncle, who left him an estate, recalled him to his native place in 1565, but he very soon became disgusted with the ignorance and arrogance of those moving in the same sphere with himself, and went back to Germany. At Wittenberg, where he resided for a short time, he lost part of his nose in a duel with a Danish gentleman; but for the lost organ he ingeniously contrived one of gold, that fitted so admirably, and was so naturally colored, that few could have detected that it was artificial. After a couple of years spent in Augsburg, he returned home, where, in 1572, he discovered a new and brilliant star in the constellation Cassiopeia. In 1573, he married a peasant girl, which his fellow-noblemen thought even more undignified than being addicted to astronomy; and that they considered very degrading in a gentleman, whose only becoming qualification was, in their estimation, expertness in the use of arms. After some time spent in travel, B. received from his sovereign, Frederic II., the offer of the island of Hven or Hoëne, in the Sound, as the site for an observatory, the king also offering to defray the cost of erection, and of the necessary astronomical instruments, as well as to provide him with a suitable salary. B. accepted the generous proposal, and in 1576 the foundation-stone of the castle of Uraniberg ("city of the heavens") was laid. Here, for a period of 20 years, B. prosecuted his observations with the most unwearied industry—with a zeal, in fact, sufficient to create a new epoch—one of the three great epochs indeed—in astronomy as a science of observation. See ASTRONOMY. The scientific greatness of B. was no protection against the petty prejudices of the nobles, who could not bear to see honor heaped on one who, according to their notions, had disgraced their order, nor against the meaner jealousies of physicians, who were annoyed at his dispensing medicine gratis to the poor. So long as his magnificent patron, Frederic II. lived, B.'s position was all that he could have desired, but on his death, in 1588, it was greatly changed. For some years under Christian IV., B. was just tolerated; but in 1597, his persecution had grown so unbearable that he left the country altogether, having been the year before deprived of his observatory and emoluments. After residing a short time at Rostock and at Wandsbeck, near Hamburg, he accepted an invitation of the emperor Rudolf II.—who conferred on him a pension of 3000 ducats—to Benatek, a few miles from Prague, where a new Uraniberg was to have been erected for him; but he died at Prague, on the 13th Oct., 1601. At Benatek he had Kepler as his assistant, and to the advice of B. that celebrated astronomer owed much. The scientific publications of B. are numerous.

BRAHILOV', IBRÄIL', or IBRAILA, is a free port of the Danubian principalities, on the left bank of the Danube, about 99 m. from its mouth, and the chief shipping port in Wallachia, whence large quantities of corn and other products are exported. The sturgeon fisheries on the Danube are a source of conisderable profit to B. A railway from Galatz to B., thence to Bucharest, was completed in 1873. Pop. about 30,000. During the war of 1854–1856, B. was occupied by Russian troops.

BRAHMA. In the religion and philosophy of the Hindus, this word has two meanings. The crude or undeclined form is *brahman*, the etymological signification of which is doubtful; when declined as a neuter noun, it has the nominative brahma (with the final syllable short); as a masculine, it is brahmā (with the *a* long). BRAHMĀ (neuter) designates the universal spirit, the ground and cause of all existence; which is not, however, conceived as an individual personal deity to be worshiped, but only as an object of contemplation. It is spoken of as "that which is invisible, unseizable, without origin, without either color, eye, or ear, eternal, manifold (in creation), all-pervading, undecaying—the wise behold it as the cause of created beings." The human soul is a portion of this universal spirit, and a man can only be freed from transmigration, and

be reunited to Brahmā, by getting a correct notion of it and of the soul.—BRAHMĀ (masculine) is one of the three chief gods of the Hindu pantheon, and is especially associated with the function of creation. See TRIMURTI. Yet he himself is a creation of or emanation from Brahmā, the first cause. The origin of Brahmā, and the way in which he created heaven and earth, is thus narrated by Manu:

"This universe was enveloped in darkness, unperceived, undistinguishable, unknowable, as it were entirely sunk in sleep. Then the irresistible self-existing lord, undiscerned, causing this universe with the five elements, and all other things, to become discernible, was manifested, dispelling the gloom. He who is beyond the cognizance of the senses, subtile, undiscernible himself, shone forth. He, desiring, seeking to produce various creatures from his own body, first created the waters, and deposited in them a seed. This [seed] became a golden egg, resplendent as the sun, in which he himself was born as Brahmā, the progenitor of all the worlds. Being formed by that first cause, undiscernible, eternal, which is both existent and non-existent, that male (purusha) is known in the world as Brahmā. That lord having continued a year in the egg, divided it into two parts by his mere thought. With these two shells he formed the heavens and the earth; and in the middle he placed the sky, the eight regions, and the eternal abode of the waters."—See Dr. J. Muir's *Original Sanskrit Texts*, vol. iv., 31.

In later times at least, B has had few special worshipers; the only spot where he is periodically adored being at Pushkara in Râjputana. He sometimes receives a kind of secondary homage along with other deities. B. is represented with four heads. See INDIA (section on *Religion*), TRIMURTI, VISHNU, SIVA.

BRAHMA (see *ante*), under which the more comprehensive term "Brahmanism" is employed to specify the system of religious institutions originated and elaborated by the Brahmans, who are and have been from an early period the sacerdotal and dominant caste among the Hindus. The earliest phases of religious thought in India of which a clear notion can now be formed, are exhibited in a body of writings which long ago came to be regarded as sacred, known under the collective name of *Veda*, "knowledge," or *Sruti*, "revelation." The Hindu scriptures consist of four separate collections of sacred texts, including hymns, incantations, and sacrificial forms of prayer. They are: 1, the *Rigveda;* 2, the *Saman*, or *Samaveda;* 3, the *Yajush*, or *Yajurveda;* 4, the *Atharvan* or *Atharvaveda*. Each of these four text books has attached to it a body of prose writings called *Brahmanas*, which explain the ceremonial application of the texts and the origin and import of the sacrificial rites for which they were supposed to have been composed. The *Samaveda* and the *Yajurveda* are for purely ritual purposes, and, as they are composed almost entirely of verses taken from the *Rigveda*, are of secondary importance. The hymns of the *Rigveda* are the earliest lyrical productions of the Aryan settlers in India which have come down to us. They all are old, though of varying periods, only the last book having the characteristics of a later appendage. Of the *Atharvan* about a sixth is found in the *Rigveda*. The religious thought of the old bards, as reflected in the hymns, is that of a worship of the grand and striking phenomena of nature regarded in the light of personal and conscious beings, endowed with powers beyond the control of man, yet sensible to his praises and actions. It was a nature-worship nearer than that of any other known form of polytheistic belief; a mythology comparatively little affected by those systematizing tendencies which, in other lands, led to the construction of a well-ordered pantheon and a regular organization of divine government. From the name, "the Shining Ones," given to these impersonations, it must be concluded that the more prominent objects of early adoration were the phenomena of light. In the primitive worship of the manifold phenomena of nature, it is not so much their physical aspect that impresses the human heart as the moral and intellectual forces which are supposed to move and animate them. The attributes and relations of some of the Vedic deities, in accordance with the nature of the objects which they represent, partake in a high degree of this spiritual element; but it is not improbable that in an earlier phase of Aryan worship the religious conceptions were pervaded by it to a still greater extent, and that the Vedic belief, though retaining many of its primitive features, has on the whole assumed a more sensuous and anthropomorphic character. This latter element is especially predominant in the attributes and imagery applied by the Vedic poets to Indra, the god of the atmospheric region, and the favorite figure in their pantheon. While the representatives of the prominent departments of nature appear to the Vedic bard as independent of each other, their relations to the mortal worshiper being the chief subject of his anxiety, a simple method of classification was already resorted to at an early time, consisting of a triple division of the deities into gods residing in the sky, in the air, and on the earth. It is not, however, until a later stage that this attempt at a polytheistic system is followed up by the promotion of one particular god to the dignity of chief guardian for each one of these three regions. On the other hand, a tendency is clearly traceable in some of the hymns towards identifying gods whose functions present a certain degree of similarity of nature. These attempts seem to show a certain advance from polytheism towards a comprehension of the unity of the divine essence. Another feature of the old Vedic worship tended to a similar result. The great problems of the origin and existence of man and the universe had early begun to engage the Hindu mind; and in celebrating the praises of the gods the poet was fre-

quently led by his religious and not wholly disinterested zeal to attribute to them cosmical functions of the very highest order. At a later stage of thought inquirers could not fail to perceive the inconsistency of such concessions of a supremacy among the divine rulers, and tried to solve the problem by conceptions of an independent power, endowed with all the attributes of a supreme deity, the creator of the universe including the gods of the pantheon. The names under which this monotheistic idea is put forth are mostly of an attributive character, and some are mere epithets of particular gods, such as *Prajapati*, "lord of creatures," and *Visrakarman*, "all-doer." But to some this theory of a personal creator left many difficulties unsolved. They saw that every thing around them, including man himself, was directed by some inward agent; and it needed but one step to perceive the essential sameness of these spiritual units, and to recognize them as so many individual manifestations of one universal principle. Thus a pantheistic conception was arrived at, and put forth under such names as *Purusha*, "soul," *Kama*, "desire," *Brahman* (neuter nom. sing., brahma), "devotion, prayer." Metaphysical and philosophical speculations were thus fast undermining the simple belief in the old gods, until, at the time of the composition of the *Brahmanas* and the *Upanishads*, we find them in complete possession of the minds of the theologians. While the theories crudely suggested in the later hymns are now further matured and elaborated, the tendency towards catholicity of formula favors the combination of the conflicting monotheistic and pantheistic conception; this compromise, which makes *Prajapati*, the personal creator of the world, the manifestation of the impersonal *Brahma*, the universal self-existent soul, leads to the composite pantheistic system which forms the characteristic dogma of the Brahmanical period.

The division into *castes* in India is well known. The hymn to Purusha names them as, 1, the Brahmanas; 2, Kshatriyas; 3, the Vaisyars; and, 4, the Sudras. There was a long conflict between the first and second of these castes, but the final subjection of the second left absolute power in the hands of the first, the Brahmans, or priests. They elaborated a system of laws, using some of Manu's code, in which they made no scruple to fortify and protect themselves. The very lowest class was of no importance, but the other three, however unequal to each other in privileges and social standing, were united by a common bond of sacramental rites, traditionally connected from ancient times with certain stages and incidents in the life of the Aryan Hindu, such as conception, birth, name-giving, the first taking out of a child to see the sun, the first feeding with boiled rice, the rites of tonsure, the youth's investiture with the sacrificial thread, and his return home on completing his studies, with the ceremonies of marriages, funerals, etc. The most important of these family observances is the rite of conducting the boy to a spiritual teacher, with which is connected the investiture with the sacred cord, ordinarily worn over the left shoulder and under the right arm, and varying in material according to the class of the wearer. This ceremony is supposed to constitute the second or spiritual birth of the arya, and is the preliminary act to the youth's initiation into the study of the Veda, the management of the consecrated fire, and the knowledge of the rites of purification, including the solemn invocation to *Savitri* (the sun), which has to be repeated every morning and evening before the rising and setting of that luminary. It is from their participation in this rite that the three upper classes are called the "twice born." The ceremony is enjoined to take place some time between the 8th and 16th year in case of a Brahman; for a Kshatriya between the 11th and 22d; and of a Vaisya between the 12th and 24th. He who has not been invested with the mark of his class within the prescribed time is forever excluded from uttering the prayer to the sun, and becomes an outcast, unless absolved from his sin by a council of Brahmans, when, after due purification, he resumes the badge of his caste. With one not duly initiated no righteous man is allowed to associate or to enter into connections of affinity. The duty of the Sudra (the lowest caste) is to serve the twice-born classes, particularly the Brahmans. One of this caste is excluded from all sacred knowledge, and if he perform sacrificial ceremonies he must do so without using holy utensils. No Brahman may recite a holy text where a man of the servile cast might overhear him, nor may he teach them the laws of expiating sin. The occupations of the Vaisya are connected with trade, agriculture, and the raising of cattle; while those of the Kshatriya consist in ruling and defending the people, administering justice, etc. Both these castes share with the Brahman the privilege of reading the Veda, but only so far as it is taught and explained to them by their spiritual preceptors. To the Brahman belongs the right of teaching and expounding the sacred texts, and also that of interpreting and determining the laws and rules of caste. Yet, in spite of those formidable barriers between the several orders, the practice of inter-marrying appears to have been too prevalent in early times to have admitted of suppression. To marry a woman of higher caste, and especially of a caste not immediately above one's own, is positively prohibited, the offspring of such a union being excluded from performing obsequies to his ancestors, and incapable of inheriting the parent's property. But, according to Manu, a man may marry a girl of any or each of the castes below his own, provided he has already a wife of his own class, since she only should perform the duties of personal attendance and religious observance devolving upon a married woman.

The self-exaltation of the highest class was due, not altogether to priestly arrogance and ambition, but, like a prominent feature in the post-Vedic belief—the transmigration

of souls—it was the natural consequence of the pantheistic doctrine. To the Brahmanical thinker, who saw in the numberless individuals of animate nature but so many manifestations of the one eternal soul, to a union with which they must all tend as their final goal of supreme bliss, the greater or less imperfection of the material form in which they were embodied naturally presented a continuous scale of spiritual units from the lowest degradation up to the absolute purity and perfection of the supreme spirit. To prevent one's sinking yet lower, and by degrees to raise one's self in this universal gradation, or, if possible, to attain the ultimate goal immediately from any state of corporeal existence, there was but one way—subjection of the senses, purity of life, and knowledge of the deity. As Manu's code concludes: "He who in his own soul perceives the supreme soul in all beings, and acquires equanimity towards them all, attains the highest state of bliss." The life marked out for the Brahmans by that stern theory of class duties which they themselves had marked out, and which must have been practiced in the early times, at least in some degree, was by no means one of ease and amenity. It was, on the contrary, well calculated to promote that complete mortification of the instincts of animal nature which they considered as indispensable to final deliverance from the revolution of bodily and personal existence.

The devoted Brahman who desired to obtain the utmost good upon the dissolution of his body, was enjoined to pass successively through four orders or stages of life, viz.: 1, that of religious student; 2, that of householder; 3, that of anchorite; 4, that of religious mendicant. Theoretically, this course was open and recommended to every twice-born man, his distinctive occupations being in that case restricted to the second condition, or that of married life. Practically, however, persons of the second and third castes were doubtless in general content to go through a term of studentship in order to obtain a certain amount of religious instruction before entering into the married state and performing their professional duties. In the case of the sacerdotal class, the practice was probably all but universal in early times; but gradually a more and more limited proportion seem to have carried their religious zeal to the length of self-mortification involved in the two final stages. When the youth had been invested with the sign of his caste, he was to reside for some time in the house of some religious teacher, well read in the Veda, to be instructed in the knowledge of the scriptures and the scientific treatises attached to them, in the social duties of his caste, and in the complicated system of purificatory and sacrificial rites. According to the number of Vedas he intended to study, the duration of the period of instruction was to be—probably in the case of Brahmanical students chiefly—of from 12 to 48 years; during which time the virtues of modesty, duty, temperance, and self-control were to be firmly implanted in his mind by unremitting observance of the most minute rules of conduct. During all this time the Brahman student had to subsist entirely on food obtained by begging from house to house; and his behavior towards the preceptor and his family was to be that prompted by respectful attachment and implicit obedience. In the case of girls no investiture takes place, the nuptial ceremony being considered an equivalent for that rite. On quitting the teacher's abode, the young man returns to his family and takes a wife. To die without leaving legitimate offspring, and especially a son to perform the periodical rite of obsequies to his father, is considered by the true Hindu a very great misfortune. There are three sacred debts which a man has to discharge in life: that which is due to the gods, of which he acquits himself by daily worship and sacrificial rites; that due to the ancient and inspired seers of the Vedic texts, discharged by the daily study of the scriptures; and the final debt which he owes to his *manes*, and of which he relieves himself by leaving a son. Some authorities add a fourth—the debt owing to human kind, which demands the practice of kindness and hospitality; hence the necessity of entering into the married state. When the husband leads the bride from her home to his own, the fire which has been used for the marriage ceremony goes with the new couple, to serve as their domestic fire; and it has to be kept up perpetually day and night, either by themselves or their children, or, if the man be a teacher, by his pupils. If it should become extinguished by neglect or otherwise, the guilt thereby incurred must be atoned for by an act of expiation. The domestic fire serves the family for preparing their food, for making the fire necessary daily for occasional offerings, and for performing sacramental rites. No food should be eaten that has not been duly consecrated by a portion of it being offered to the gods, the beings, and the *manes*. These three daily offerings are also called by the collective name of the sacrifice to all the deities. The remaining two are the offering to Brahma—that is, the daily lecture of the scriptures, accompanied by certain rites—and that to men, consisting in the entertainment of guests. The domestic observances, many of which must be considered as ancient Aryan family customs, surrounded by the Hindus with a certain amount of adventitious ceremonial, were generally performed by the householder himself, with the assistance of his wife. There is, however, another class of sacrificial ceremonies of a more pretentious and expensive kind, called srauta rites, or rites based on revelation, the performance of which, though not indispensable, was yet considered obligatory under certain circumstances. They formed a powerful weapon in the hands of the priesthood, and were one of the chief sources of their subsistence. Owing to the complicated nature of these sacrifices, and the great amount of ritualistic formulas and texts recited during their performance, they required the employment of a number of profes-

sional Brahmans, frequently as many as 16, who had to be well rewarded for their services. Priests who refuse money for their services are eulogized by Brahmanical writers; but such virtue was rare. The manuals of the Vaidak rituals generally enumerated three of these rites: *ishtis*, or oblations of milk, curds, clarified butter, rice, grain; annual offerings; and libations of *soma*. The soma, which is an intoxicating drink prepared from the juice of a kind of milk-weed, sometimes called the moon-plant, must have played an important part in the ancient worship, at least as early as the Indo-Persian period. It is continually alluded to both in the *Zend Avesta* and the *Rigveda*. In the latter work the hymns of a whole book are addressed to it, either in the shape of a mighty god, or in its original form, as a kind of ambrosia endowed with wonderfully exhilarating powers. In post-Vedic mythology *soma* has become identified with the lunar deity, to whom it seems to have had some relation from the beginning. Among the Vaidik rites the soma-sacrifices are the most solemn and complicated, and those to which the greatest efficacy is ascribed in remitting sin, conferring offspring and even immortality. They require the attendance of 16 priests, and are divided into three groups, according as the actual pressing and offering of the soma occupies only 1 day, or between 1 and 12 days. The performance of all srauta sacrifices require two other fires besides that used for domestic rites. The act of first placing the fires in their respective receptacles, after due consecration of the ground, constitutes the essential part of the first duty, which the householder should have performed by four Brahmans immediately after the wedding. To the same class of sacrificial ceremonies belong those performed on the days of the new and full moon, the oblation at the commencement of the three seasons, the offerings of first-fruits, and other periodical rites. Besides these regular sacrifices, the srauta ceremonial includes a number of most solemn rites, which, on account of the objects for which they are instituted, and the enormous expenditure they involve, could be performed only on rare occasions and by powerful princes. Of these the most important are the inaugural ceremony of a monarch who claims supreme rule, and the horse sacrifice, one of great antiquity, enjoined by the Brahmanical ritual upon kings desirous of attaining universal sovereignty. The efficacy ascribed to this ceremony in later times was so great that the performance of a hundred such sacrifices was considered to deprive Indra of his position as chief of the immortals.

When the householder is advanced in years, when he sees his skin become wrinkled and his hair gray, when he sees the son of his son, the time is said to have come for him to enter the third stage of life. He should now disengage himself from all family ties—except that his wife may accompany him if she choose—and repair to a lonely wood, taking with him his sacred fires and the implements required for the daily and periodical offering. Clad in a deer's skin, or in a single piece of cloth, or in a bark garment, with his hair and nails uncut, the hermit is to subsist exclusively on food growing wild in the forest, such as roots, green herbs, fruits, wild rice and grain. He must not accept gifts from any one, except of what may be absolutely necessary to maintain him; but with his own little hoard he should, on the contrary, honor to the best of his ability those who visit his hermitage. His time must be spent in reading the metaphysical treatises of the Veda, in making oblations, and in undergoing various kinds of privations and austerities, with a view to mortifying his passions and producing in his mind an entire indifference to worldly objects. Having by these means succeeded in overcoming all sensual affections and desires, and in acquiring perfect equanimity towards everything around him, the hermit has fitted himself for the final and most exalted order, that of the devotee or religious mendicant. As such he has no further need of either mortifications or religious observances; but "with the sacrificial fires reposited in his mind" he may devote the remainder of his days to meditating on the divinity. Taking up his abode at the foot of a tree in total solitude, "with no companion but his own soul," clad in a coarse garment, he should carefully avoid injuring any creature or giving offense to any human being that may happen to come near him. Once in a day, in the evening, "when the charcoal fire is extinguished and the smoke no longer issues from the fire-place, when the pestle is at rest, when the people have taken their meats and the dishes are removed," he should go near the habitations of men in order to beg the little food that may suffice to sustain his feeble frame. Ever pure of mind, he should thus bide his time, "as a servant expecteth his wages," wishing neither for death nor for life, until at last his soul is freed from its fetters and absorbed in the eternal spirit, the impersonal, self-existent Brahma.

The study of the ancient Hindu literature has taught us that some practices which have hitherto, or until recently, prevailed in India, and which have contributed much to bring Hindu morals into disrepute, are comparatively modern innovations. Thus, the rites of *sutte* (prop. *sati*, "the faithful wife") or the voluntary immolation of widows, which was abolished with considerable difficulty about 30 years ago, seems to have sprung up originally as a local habit among the Kshatriyas, and, on becoming more and more prevalent, to have at length received Brahmanical sanction. The alleged conformity of the rite to the Hindu scriptures has been shown to have rested chiefly on a misquotation, if not an intentional garbling, of a certain passage of the *Rigveda*, which, so far from authorizing the cremation of the widow, bids her return from the funeral rite to her home and resume her worldly duties. Cases of infanticide are still frequent in many parts of India, especially among the Rajputs; but the priests have never sanc-

tioned the practice. Its origin has to be sought in the enormous extravagances of wedding feasts, and in a notion that parents are disgraced by their daughters remaining husbandless. Hence, also, the practice of early marriage, which is the more mischievous as the Hindu law does not allow widows to marry. The cow has been held in high honor in India from early times; but the abhorrence of slaughtering and eating the flesh of kine is of late origin. It has been conclusively shown by a Hindu scholar that in former times beef formed a staple article of food. (For particulars and varieties of Hindu doctrines, etc., see INDIA, BUDDHISM, PARSEES, SIKHS, VEDA, MARUT, SURYA, USHAS, UPANISHAD, METEMPSYCHOSIS, VEDANTA, VAISHNAVAS, SAIVAS, SAKTAS.)

BRAHMAN, or BRAHMIN, the name of the highest caste (q.v.) in the system of Hinduism.

BRAHMANBE'RIA, a t. of India in the presidency of Bengal, division of Chittagong. It has sea and railway communication with Calcutta. Pop. '72, 12,364.

BRAHMAPU'TRA, a river which rises in Thibet, and, after partially mingling with the Ganges, flows into the bay of Bengal by three mouths. It is formed by the junction, in Assam, of two main branches—the Brahmaputra, from the n.e., and the Sampoo, from the n.w.; the entire length rather exceeds 900 m. from the one source, and 1700 from the other. The B. proper rises about lat. 28° 30′ n., and long. 97° 20′ e.; while the Sampoo springs from the same swamp as the Sutlej and the Indus. About 360 m. below their confluence, the B. leaves Assam, near Goulpara, and after 60 m. more in a s.w. direction, takes a sweep round the w. extremity of the Garrow mountains. In lat. 25° 10′ n., and long. 89° 43′ e., it throws off the Konaie, and after a course of 180 m. is named the Meghna. Ninety m. from the sea, it combines with the Ganges in cutting up their common delta into a net-work of inland navigation.

BRAHMIN OX. See ZEBU.

BRAHMO SOMAJ (*Theistic Church*) is a religious and social association in India, originated by the celebrated Hindu rajah, Rammohun Roy, in 1830, under the title, *Society of God*. The accession of Debendra Nath Tagore, a wealthy Calcutta Brahman, in 1842, gave the movement a great impetus, which was also much aided by the spread of English education. Its latest and most advanced development took place under Keshub Chunder Sen, who joined it in 1858, and whose visit to Europe in 1870 created so much interest. It has been Sen's aim to apply the principles of the church to practical life, and under his leadership the progressive party have seceded from the original church, and assumed the title of "Bramo Somaj of India." Their fundamental principles are that there is but one supreme God, the object of worship; that nature and intuition are the sources whence our knowledge of God is derived; and that religion admits of progressive development. They ignore all distinctions of caste, and consider all men as God's children; they abjure all idolatrous rites, and acknowledge no sacred books or places, but value what is good and true in all religions, and recognize the necessity of public worship. They have about 100 branches throughout India, and maintain two periodicals and several schools.

BRAIN is the nervous center in which reside consciousness and power over the voluntary movements of the body. It consists of one or more masses of *gray* and *white* nervous matter, or what are technically called vesicular and tubular neurine. When these substances are blended together, the mass is termed a *ganglion*, and from it proceed prolongations of the tubular matter, which are called nerves, and are conductors of impressions to or from the the vesicular neurine. The number and size of these ganglia vary with the powers of the animal. In the lowest forms of mullusk, we find a single ganglion from which proceed all the nerves of the animal; in the higher, there are two ganglia, joined by a nervous cord round the gullet, and distinct from, though connected with, the ganglion which supplies nerves to the foot, and the one for the respiratory apparatus. In the common slug, we have these cephalic ganglia united so as to form one bilobed mass of B. above the œsophagus.

In the ARTICULATED ANIMALS (q.v.), the B. consists of two cephalic ganglia over the œsophagus; there are also two nervous cords, one on each side of the body connected with each other. In the *cephalopoda*, as the pearly nautilus, the B., or mass of nervous matter situated over the gullet, is a transverse *cord*-like ganglion; in the cuttle-fish (*sepia officinalis*) we find a distinct rounded mass, supported by a rudimentary skeleton. In FISHES, we find, instead of one supra-œsophageal mass or ganglion, several separate masses, the nerves ending in their own special ganglia; i.e., where each nerve ends or begins in the B., there is a collection of vesicular neurine. In addition to these ganglia in fishes, there are parts corresponding to the cerebral lobes or hemispheres of the human brain. There is also a cerebellum.

Suppose we examine a cod's brain. Removing the roof of the skull, we see three pair of neurine masses; two small and round in front, the hemispherical ganglia; two larger in the middle, the *optic* ganglia; and a little triangular appendage behind, the cerebellum. From just in front of the anterior of those three pairs of masses diverge nervous prolongations, which end in two bodies, called the *olfactory* ganglia. On lifting the appendage we have named cerebellum, we see on each side of the spinal cord a deposition of neurine, which represents the *auditory* ganglia of more fully developed

brains. The olfactory ganglia vary in their distance from the general mass. In REPTILIA, they are placed very near the cerebral hemispheres, which are small, as is also the cerebellum. But when we reach the BIRDS, the size of the cerebral lobe, in proportion to all the other parts, is much increased, so that they overlay the different ganglia, which are not placed one in front of the other, as in fishes and reptiles, but packed one above the other. We now begin to find some indications of *convolutions*. On the surface of the B. in the parroquet, Leuret describes the furrowing as distinct, though many birds have perfectly smooth hemispheres; these also are not hollow, as in fishes and reptiles; and it will be seen that the convoluting or folding of the B. substance backwards and forwards, must allow of more being packed into the space than could be admitted by any other arrangement. The middle part of the cerebellum is very large, and divided into laminæ or leaflets; its lateral portions are much smaller than in mammalia: the olfactory ganglia are small, and close to the cerebral hemispheres. The optic ganglia and other nerves rising from them are very large, and the wedge-shaped portion, called *medulla-oblongata*, connecting the B. with the spinal cord, is also large. We now approach the MAMMALIA, and in the *monotremata*, which in some important respects resemble birds—the *ornithorhynchus paradoxus*, for instance—we find small smooth hemispheres in a B. which to the whole body bears only the proportion of 1 to 130. Even this is greater than in the marsupials; the kangaroo's B. is as 1 to 800.

If we examine a rabbit's B., we find it to consist, apparently, of three parts—the *olfactory bulb*, the *cerebral hemispheres*, and the *cerebellum*. The cerebral hemispheres are connected by a transverse band of union, or what is technically termed a *commissure*. Continuing the dissection, we turn aside the hemispheres, and find they have concealed *four ganglia*, which represent the single pair of optic ganglia we found in birds. There are two other bodies in front of those just alluded to—viz., the *optic thalamus*, and in front of it another (inferior) *longitudinal commissure*. This forms a communication between the anterior and posterior portions of the hemisphere, on the same side. Two little white lines, running from the back of the thalami, join a little body called the *pineal gland*, interesting in connection with some fantastic physiological theories. It will be observed that the hemispheres lie over these structures like a cap; the space between the two, on each side, is termed the *lateral ventricle*.

We have now the most complicated B. before us, the human encephalic mass of ganglia, and include with it the *medulla oblongata*, the link which unites the B. to the spinal cord. First viewing the B. from its upper surface, we see that it is divided by the longitudinal fissure into two equal halves or hemispheres, which are broader behind than in front. They are irregularly marked by convolutions, and a smooth appearance is given to the whole surface by the glistening arachnoid membrane (q.v.). On slicing them transversely with a knife, the section appears white in the center, and gray at the margins, of the *convolutions*, which are now seen penetrating to various depths below the surface. The white substance is dotted with the blood-vessels which supply the brain. On drawing the hemispheres asunder from each other with the fingers, the great commissure, or uniting band, is seen, the *corpus callosum*, which is streaked both longitudinally and transversely. The hemispheres should now be completely sliced off on a level with this commissure, and its transverse fibers will be seen to extend into their substance, constituting a large white surface, called by anatomists the *white oval center*.

If we take the handle of the knife, and scratch with it through this white substance, the instrument soon opens a cavity, which is the *lateral ventricle*. Let this be done on both sides, and the ventricles exposed to view. They are shaped somewhat like the italic *S*. Their extremities are termed cornua, and the anterior look from each other, and are nearer than the posterior, which are turned the opposite way. We have now removed the hemispherical ganglion, and uncovered the others. The pia mater, which supports the vessels bringing blood to the B. substance, is seen in a purple wreath lying in each ventricle, and passing down into a depression termed the *middle horn* of the ventricle. This is the *choroid plexus*, and, if lifted, it will be found continuous with that on the opposite side, through an aperture called the foramen of Monro, after the great Scotch anatomist of that name. If the remains of the corpus callosum are now scraped away, the choroid plexus will be found continuous with a web of pia mater called the *velum interpositum*, which lies over the central cavity of the B., or third ventricle. In front and behind will be seen portions of the inferior longitudinal commissure or *fornix*, the body of which has been removed to show the velum; but, placed vertically between its anterior part and the under surface of the corpus callosum, are two layers of gray matter, between which is a narrow space termed the *fifth ventricle*. Behind, there will be seen a small hole, through which a probe will pass into the *fourth ventricle*.

We now come to the upper surface of the *cerebellum*, consisting of two hemispheres split transversely into leaflets, and connected by a central portion to each other, and by two bundles of white fibers to the corpora quadrigemina. Between these is the *fourth ventricle;* and stretched across between them is a thin layer of gray matter, called the *valve of Vieussens*.

We now turn what remains of the B. upside down, and examine the base or under surface. It is very irregular in outline. The cerebral hemispheres are now found to be divided on each side by a *fissure* (*Sylvian*). The part in front is called the

anterior lobe; that behind the *middle,* as far as the cerebellum, when it is called the *posterior lobe.*

The olfactory lobes are now seen lying in a fissure in the anterior lobes. The optic tracts are seen meeting at their commissure, interchanging fibers, and passing on as the optic nerves to the orbit. The larger bundles behind, and directed outwards, are the *crura cerebri,* passing towards the hemispheres, emerging from the transverse mass called the *pons varolii,* which lies like a clamp between the two halves of the cerebellum. From the inner side of each crus arises the third nerve, destined to supply four of the muscles which move the eyeball. The fourth nerve comes from the valve of Vieussens, and is seen on its way to supply the superior oblique muscle which turns the eye upwards and outwards, hence called *patheticus.* From each side of the pons the fifth pair arises; the sixth, between the pons and the anterior pyramids of the medulla oblongata; the eighth, consisting of: 1. The glosso-pharyngeal, or nerve of deglutition. 2. The pneumogastric distributed to the respiratory apparatus and stomach; and with it, 3. The spinal accessory.

The chemical composition of B. matter averages in 100 parts—

Water	
Albuminous matter	75½ parts.
Fat	7 "
Salts (containing 1½ of phosphoric acid)	11½ "
	6 "

The proportion of these constituents varies not only in different species of animals, but also in different members of the same animal group, and appears to be much influenced by the age, temper, and intellectual capabilities of each individual. Thus, the normal quantity of salts in the B. of a healthy man is 6 per cent, and in the B. of an insane patient, only 2¼ per cent were found.

Softening of the brain (ramollissement) is a frequent result of chronic inflammation of the brain. The patient has been for some time in low health, troubled with headaches, loss of appetite, depression of spirits, and a gradual loss of memory, and acute perception of things in general. Then a spasm may occur, followed by paralysis, or the legs and arms may be bent up, and remain in that position. This condition of B. may be caused by want of proper nourishment to the cerebral substance, owing to plugging up, or from disease of its arteries. When the softening is caused by inflammation, we frequently find pus forming an abscess of the brain. Induration may also occur as the result of inflammation.—The other diseases, as hydrocephalus, will be treated under their own names.

Diseases of the brain.—Inflammation (acute) of the B. (*phrenitis,* or popularly, *brain fever*) rarely occurs separately, and can scarcely be distinguished from inflammation of its membranes (meningitis). According to Dr. Watson of London, when the disease begins in the latter, the first remarkable symptom is a convulsion fit; when in the B. substance itself, nausea and vomiting generally usher in the attack.

In the first stage, there is rapid pulse, severe headache, the eyes suffused, and their pupils contracted to a small point, very intolerant of light. The patient is constantly watchful, and much annoyed by even ordinary sounds. Then furious delirium sets in, and lasts for a period, varying with the case, generally from twelve to forty-eight hours; when it is succeeded by collapse, in which the patient lies—his face devoid of color, and covered with cold sweat—in a state of stupor. If roused, he now speaks with slow, indistinct utterance; his pupils are now dilated, and indifferent to the brightest light; and the loudest speaking ceases to annoy him. The stupor increases with the general prostration, and continues till death. After death, we find serous fluid upon and in the B., deposits of lymph, thickening of the membranes, and softening of the B. substance itself.

General and local bleeding, with antimony and digitalis, to subdue the pulse; mercury, to prevent the deposit of lymph; blisters, as counter-irritants, to the back of the head and neck, are the usual remedies for this rare, but terrible disease. The younger school of practitioners, however, as Dr. Tanner expresses it, prefer waiting to see if nature unaided, or only *gently guided,* will not carry the patient through a disease where the efforts of art are notoriously futile, and are rather content to *watch the symptoms,* to calm excitement by sedatives, to lessen increased heat of body by diluents and tepid sponging, to prevent accumulations in the intestines by purgatives, and to diminish maniacal delirium by the application of cold to the head.

BRAIN, DISEASES OF THE, are comprehended in six general classes, viz.: 1. Cerebral congestion; 2. cerebral anæmia; 3. cerebral hemorrhage; 4. inflammatory diseases; 5. structural lesions; 6. functional disturbances. Active congestion of the B. is a well-known and dangerous disease; but may often be removed by proper treatment. Cold applied to the head, and warm stimulating applications to the extremities, are very useful. Passive congestion is marked by a livid face, dull pains, sluggishness of the mental faculties, and disturbed sleep. Cerebral anæmia includes diseases arising from impoverished or otherwise disordered blood, and is marked by frequent fainting, paleness of the face, and gasping as if actually dying. The natural remedies are to stimulate the action of the heart so as to increase the flow of blood to the head, and placing the body in a horizontal position, with the head lowest. Dashing cold water into the face will

often excite the heart to the required action. There are many other forms of anæmia, general or partial. Cerebral hemorrhage, or bleeding in the substance or between the parts of the brain, is generally a consequence of disease of the arteries of the B., and is often developed in apoplexy or hemiplegia. In attacks of apoplexy dependent upon extravasation of blood, the body should be kept quiet, with the head raised, applying cold water or ice thereto, and removing all articles of clothing that may press upon the neck or chest. It should be known that cerebral hemorrhage is seldom preceded by symptoms; hence, in general, ringing in the ears, dizziness, and other symptoms which some fear to be indicative of an apoplectic attacks are really not so. Inflammatory affections of the brain are seated either in the membranes or the cerebral substance, oftenest in the former. They are generally included in the term meningitis, which is acute, subacute, or chronic, and there is a tuberculous variety. The causes in cases not arising from actual injury to the head, are generally excessive use of alcoholic liquors, or exposure to severe heat. This form of development occurs chiefly in adults. Children are oftener subject to acute inflammation in the course of measles, scarlet fever, or erysipelas. The leading local symptoms of acute meningitis are pain in the head, a flushing of the face, intolerance of loud sounds and strong light, increased sensibility of the surface of the body, throbbing of the arteries in the neck and head, and delirium which is often violent and accompanied with hallucinations. There is usually fever, and sometimes there are convulsions. In the second stage there is heavy sleepiness ending in coma, paralysis of some of the facial muscles or of the limbs on one side, dilatation of the pupils, and irregular pulse; symptoms that betoken speedy death. A very large proportion of cases of simple acute meningitis end fatally, sometimes almost immediately or within a few hours, but occasionally a week may intervene. Treatment should be directed by a physician. When acute cerebral meningitis affects the membranes of the spinal cord, it is not only extremely fatal but is epidemic. There are other varieties of more or less importance that can be understood only by professional men, and, as a matter of safety, all brain affections should be dealt with under the direction of a physician. The same must be said of lesions affecting the structure of the brain, too many and various to describe; and to these must be added functional diseases which produce mania, monomania, melancholia, dementia, etc.

BRAINARD, JOHN GARDINER CALKINS, 1796–1828; b. Conn.; a graduate of Yale; editor of a newspaper in Hartford, in which he published many pieces of verse. After his death a volume of his poems was published, and a third edition was issued in 1832, with a memoir by John G. Whittier. B. ranks high in class next below the greatest American poets.

BRAINE-LE-COMTE, a busy t. of the province of Hainault, Belgium, about 13 m. n.n.e. of Mons. It is an ancient place, and formerly belonged to the monks of St. Waudru at Mons, from whom it was bought by count Baldwin in 1158. It has an old church of the 13th c.; and cotton and corn mills, dye-works, breweries, etc. Some of the finest flax that can be produced is grown in the district. Pop. '70, about 6400.

BRAINERD, DAVID, 1718–47; an American missionary, b. Conn. His missionary work was among the Indians in Massachusetts and those around the Delaware and Susquehanna rivers. President Edwards wrote his biography, and that and B.'s journals are well known. B. was a man of strong mental powers, extensive knowledge, great sagacity, and fervent zeal, and as a preacher he was forcible and pathetic.

BRAINSTONE CORAL, the popular name of certain kinds of coral (q.v.) or madrepore (q.v.), included in the Linnæan genus *madrepora*, but now forming the much more restricted genus *meandrina*. They derive their name from the general resemblance to the brain of man or of a quadruped exhibited in their large rounded mass, and numerous winding depressions. Perhaps the true B. C. is *meandrina cerebriformis*, a species always nearly hemispherical. When the hemispherical mass is broken, the ridges which bound its furrows may be traced inwards through its substance, even to the central nucleus from which they commenced. The mouths of the polypes, in all the species of this genus, are in the furrows or elongated hollows, in which they are ranged side by side, in sinuous series. The brainstone corals are very common in collections, and are much admired for their beauty. They are found chiefly in the seas of warm climates, particularly in the Indian and s. Atlantic oceans. They sometimes attain a large size. Ehrenberg noticed single masses (polypidoms) in the Red sea, from 6 to 9 ft. in diameter. Their rate of growth, however, appears to be slow. The fossil species are few, and chiefly belong to the oolitic formation.

BRAINTREE, a t. in Norfolk co., Mass., 10 m. s. of Boston, on the Old Colony, Newport and Southside railroads; pop. '70, 3948; in '80, 3856; a manufacturing place for boots and shoes, linen, woolen, paper, machinery, etc. The town of Quincy was formerly included in Braintree.

BRAINTREE, a market-town of Essex, about 40 m. n.e. from London. It is an old place, having been constituted a market-town by king John. Its streets are narrow, and many of its houses are of wood. It has manufactures of silk, crape, and straw-plait. It is one of the polling-places for n. Essex, and has obtained some notoriety in connection with political and ecclesiastical proceedings. Pop. of parish, '71, 4790.

BRAIZE, or BECKER, *Pagrus vulgaris*, the fish popularly called the porgie, or scup; a common and good table-fish.

BRAKE, a genus of ferns of the division *polypodeæ*, distinguished by spore-cases in marginal lines covered by the reflexed margin of the frond. The COMMON B. or BRACKEN (*P. aquilina*) is very abundant in Britain and in most parts of the continent of Europe, growing in heaths, parks, etc., often covering considerable tracts. It is a widely distributed plant, and is found in many parts of Asia, and in some parts of Africa. It has a long, creeping, black rhizome, or root-stock, from which grow up naked stalks of 8 to 18 in. in height; each stalk divides at top into three branches; the branches are bipinnate, the inferior pinnules pinnatifid. The root-stock, when cut across, exhibits an appearance which has been supposed to resemble a spread eagle, whence the specific name *aquilina* (Lat. *aquila*, an eagle). The root-stock is bitter, and has been used as a substitute for hops; it has also been ground, mixed with barley, and made into a wretched bread in times of distress. The plant is astringent and anthelmintic; and as such, it had at one time a high reputation, although it is now little used, at least by medical practitioners. It is employed in dressing kid and chamois leather. The ashes, containing a large quantity of alkali, were formerly used in the manufacture of soap and of glass, so that the collecting of them for sale was a considerable resource of the poor in some parts of the Hebrides. B. is also employed for thatching, for littering cattle, etc., and occasionally chopped up with straw or hay, for feeding cattle. It is a favorite covert of deer and other game. The abundance of this plant is sometimes regarded as a sign of poor land, although, probably, its absence from the richer soils is very much a result of cultivation. To extirpate it, nothing more is necessary than a few successive mowings of the young shoots as they appear. The annual growth of B. is killed by the first frosts of autumn, but remains rigid and brown, still affording shelter to game, and almost as characteristic a feature in the landscape of winter as in that of summer, perhaps adding to its general desolateness.—*Pteris caudata*, a large species of B. very similar to that of Europe, is one of the worst pests which the farmer has to contend with in the s. of Brazil.—*Pteris esculenta*, a native of New Zealand, Van Diemen's Land, etc., has a more nutritious rhizome than the common brake. See TARA FERN.—Rock B. (*cryptogamma crispa* or *allosorus crispus*, formerly *pteris crispa*) is a pretty little fern, common on stony hills in the northern parts of Britain.

BRAKE, a contrivance to stop motion by friction, applied mainly to car wheels and hoisting apparatus. Originally it was a flexible iron band so placed that it might be drawn tightly around most of the outer surface of the revolving wheel, the friction gradually slackening the motion. In carriages curved blocks of wood were used, and pressed against the tire by a lever worked with the hand or the foot. Modern invention has given us systems of brakes that may be instantly applied to every wheel in a train of cars. For the Creamer brake, once somewhat in favor, a powerful spiral spring was the power applied. This spring was coiled in a drum through which a shaft passes, and was set free by the brakeman, or all the brakes on a train could be set free by one act of the engineer. The Westinghouse air-brake is now very generally used in America. Each carriage has beneath its floor a cylinder and piston which may be operated by compressed air; the piston acts on suitable levers and rods to set the brakes against the wheels, the brakes being also connected with the ordinary braking mechanism at the platform of the cars. Compressed air is conveyed to the cylinders by tubes leading from a reservoir at the locomotive, and this reservoir is filled by a special engine which is independent of the ordinary motive mechanism. The special engine acts automatically, starting when the pressure of air in the reservoir is below a fixed standard, and stopping when the pressure reaches another fixed standard. The engine-driver communicates the compressed air to the cylinders by the simple act of turning a valve-handle through one fourth of a circumference; the brakes are instantly "set" with great force throughout the train. A different system uses a vacuum, and the pistons beneath the cars are acted on by atmospheric pressure, when the cylinders are in communication with the vacuous reservoir. The Westinghouse and the other air brakes serve to place the train very fully under the control of the engine-driver; permitting the stoppage of trains from high speed in a very short space.

BRAMA, a genus of fishes of the family *chætodontidæ* (q.v.). *B. raii* is common in the Mediterranean, and occasionally found on the British shores. It is one of the fishes to which the name bream (q.v.) or sea-bream has been given; and it has also been described as a gilt-head (q.v.); but these names belong to fishes of other families, with some similarity of general appearance. The genus B. has the body very deep and compressed, the head rather obtusely terminated, a single elongated dorsal fin, and the anal fin with a very lengthened base. The tail is forked, its points extremely divergent. This fish is sometimes more than 2 ft. in length. Its flesh is of exquisite flavor.

BRAMAH, JOSEPH, an eminent practical machinist, the son of a farmer, was born at Stainborough, Yorkshire, April 13, 1749, and early exhibited an unusual talent for mechanics. Incapacitated in his 16th year from agricultural labors by an accidental lameness, he was apprenticed to a carpenter and joiner, and afterwards obtained employment with a cabinet-maker in London. Subsequently, he established himself in business in the metropolis, and became distinguished for the number, value, and inge-

nuity of his mechanical inventions, such as safety-locks, improvements in pumps and fire-engines, in the construction of boilers for steam-engines, in the processes of making paper, in the construction of main-pipes, wheel-carriages, the beer-machine used at the bar of public-houses, and many others. About 1800, he constructed the hydrostatic press known by his name. See HYDRAULIC PRESS. In all, he took out about twenty patents. He died 9th Dec., 1814.

BRAMANTE, DONATO LAZZARI, one of the most celebrated Italian architects, and also distinguished as a painter, was born at Monte-Asdroaldo, in the duchy of Urbino, 1444. From 1476–99, he resided in Milan, where he studied geometry and perspective, neither of which sciences was well understood by artists in his day. He was noted as one of the best painters in Lombardy; but his success in architecture eclipsed his fame as a painter. In Milan, he built the choir of Santa-Maria delle Grazie, and the church of Santa-Maria presso San-Satiro. After the fall of Ludovico Sforza, B. went to Rome, where he wast first employed by the pope Alexander VI., and afterwards by Julius II. The first great work which he undertook for the latter was to connect the Vatican palace with the two pavilions of the Belvedere by a series of immense galleries; the second was the rebuilding of St. Peter's church, of which he laid the new foundation in 1506. When only a small portion of his plans had been realized, B. died at Rome, 1514, and succeeding architects departed widely from the original design of a grand cupola over a Greek cross. Among other works of B. in Rome may be mentioned the palaces Cancellaria and Giraud (now Torlonia), in which he adhered more strictly than in other works to antique forms, but not without a characteristic grace in his application of these.

BRAMBANAN', a district of the province of Soorakarta, Java, rich in remains of Brahmanical temples, which are superior in magnificence to any in India. The edifices are composed entirely of hewn stone, and no mortar has been used in their construction. In all, there are 296 temples, disposed in five parallelograms, one within the other. The outer one consists of 84 temples; the second, of 76; the third, of 64; the fourth, of 44; and the inner one, of 28. In the center stands the largest and most imposing structure of all. It is 90 ft. high, and profusely decorated with mythological figures, which are executed in a very fair style of art. On the s. face of the outside parallelogram, there are two monstrous figures, with uplifted clubs, kneeling in a threatening attitude. The great temple is pretty entire, as are also about a third of the others, but the rest lie strewn upon the ground.

BRAMBLE, *Rubus fruticosus*, a plant common in Britain and most parts of Europe, having prickly stems, which somewhat resemble those of the raspberry (q.v.). The flowers do not appear till the summer is considerably advanced, and the fruit ripens towards the end of it, continuing to be produced till the frosts of winter set in. The fruit (brambleberry or blackberry) is too well known to need description. Besides affording much enjoyment to children, who collect it from hedges and thickets, it is sometimes offered for sale in towns, and jelly and jam are prepared from it of very delicate flavor, besides a wine, which, both in strength and flavor, is held by many to excel all products of similar native fruits of Britain. The B. is rarely cultivated, perhaps because it is in most districts so abundant in a wild state; but it seems to deserve attention at least as much as the raspberry, and might probably be as much improved by cultivation. A slight rail on each side of a row of brambles, to restrain the straggling stems, affords the necessary security for neatness and order, and the care bestowed is repaid by abundance of fruit, very acceptable where wild-brambles are not plentiful, and at a season when there is no other small fruit in the garden.—There are many different species of B., according to some—varieties according to other—botanists, to which the name is indiscriminately given, and which may almost all be regarded as belonging to the Linnæan *rubus fruticosus*. From this was separated *R. corylifolius* of Smith, a common British plant, and from these some German and British botanists have separated many other alleged species. *R. suberectus* has more the habit of the raspberry than most of the other kinds, but even its claims to be received as a species are not admitted without doubt by some of the most eminent botanists. A variety of B. with white fruit is occasionally met with.—Species of *rubus* very similar to the common B., or varieties of it, abound in the northern parts of Asia, the Himalaya mountains, and North America. See RUBUS.

BRAMBLING, BRAMBLE FINCH, or MOUNTAIN FINCH, *Fringilla montifringilla* (see FINCH and FRINGILLIDÆ), a bird nearly allied to the chaffinch (q.v.). It is a little larger than the chaffinch, which it much resembles in its general appearance, its bill, and even the disposal of its colors. The tail is more forked. In the males, the crown of the head, the cheeks, the back and sides of the neck, and the upper part of the back, are mottled in winter with brown and black; but in spring, the whole of these parts become of a rich velvety black; the throat and breast are of a rich fawn color, which is also the prevailing color of the wings, but they are crossed, when closed, by an oblique band of jet-black, and by another oblique band of white. The quill-feathers are also black, edged with yellow on their outer webs; the tail-feathers black, edged with reddish white; the rump and the belly are white; a small tuft of feathers under each wing and some of the lower wing-coverts are bright yellow. The B. is a mere winter visitant in Britain,

and the period of its arrival appears to vary according to the severity or mildness of the weather in the more northerly regions. The B. has never been known to breed in any part of the British islands, and even in the s. of Sweden it is a mere winter visitant. It breeds in the more northerly parts of Scandinavia. It has no song, its call-note is a single monotonous chirp. It is a very widely distributed species, being found as far e. as Japan, and, in its winter migrations, visiting Italy, Sicily, Malta, Smyrna, etc.

BRAMPTON, a very ancient t. in the co. of Cumberland, near the Arthing, 8 m. e.n.e. of Carlisle. It is surrounded by hills; and the Castle-hill commands a very extensive view. Pop. '71, 2617. The chief manufacture is the weaving of checks and ginghams; and there are coal-mines in the vicinity. On a rock, 2 m. to the s., is a Roman inscription, supposed to have been cut by one of Agricola's legions in 207 A.D. Two miles to the e. stands Lanercost abbey, founded in 1116.

BRAN is the material obtained from the outer covering or husk of grain during the process of grinding, and which is separated from the finer flour before the latter is made into bread (q.v.). It is generally met with in commerce in thin scaly yellowish-brown particles, with sharp edges, and its composition in 100 parts is as follows:

Water	13.1
Albumen (coagulated)	19.3
Oil	4.7
Husk, with a little starch	55.6
Ash or saline matter	7.3
	100.0

Bread made of flour, containing B., is known as *brown bread*. See BREAD. The main uses to which B. is put are in the feeding of horses and cattle, and poultry, and in clearing and brightening goods during the processes of dyeing (q.v.) and calico-printing (q.v.). In the practice of medicine, B. is employed as a warm poultice in abdominal inflammation, spasms, etc., and an infusion is used as an emollient footbath. It is also used internally in catarrhal affections.

BRANCALEO'NE, DANDOLO, d. 1258; a Ghibelline senator of Bologna, famous for his firmness in restoring order in a lawless period. He executed leading men of the most powerful families, and destroyed the strongholds of disturbers of the peace, checked the power of the church and the nobles, and with the strong hand suppressed public robbery. Yet he was deposed and arrested, and was in danger of execution; but he held hostages of the great families and was restored to power. His death was greatly lamented, and it was reported that "his head, inclosed in a costly vase, was deposited in a lofty column of marble."

BRANCH, in botany, is a part of a tree or other plant not taking its rise immediately from the root, but rather forming a sort of division of the stem, and which is often divided into secondary branches, again, perhaps, to be further much ramified into *branchlets* and twigs, the ultimate ramifications producing leaves, flowers, and fruit. Branches originate in leaf-buds, which are produced at the *nodes* of the stem, or of the already existing bran ches. See BUD, PLANT, and STEM. The buds being formed in the axils of leaves, the arrangement of the branches, as alternate, opposite, whorled, etc., varies like that of the leaves, but buds often remain dormant, according to a regular law of alternation. The angles of ramification are very different in different plants, producing great variety of appearance, and giving marked characteristics to different kinds of trees. The great difference between the ramification of the *coniferæ* in general (pines and firs) and that of other trees must have attracted the attention of every one. In many herbaceous plants whose axis is scarcely developed into a stem, instead of branches there proceed from the lateral buds *runners*, which lie close to the ground, send down roots, and produce new plants, as in the strawberry.

BRANCH, a co. in s. Michigan, on the Indiana border; 578 sq.m.; pop. '80, 27,941; undulating surface, with forests and oak-openings; fertile, producing the usual agricultural crops. There is iron in some places. The railroads are the Michigan Central and Fort Wayne, and the Jackson and Saginaw. Co. seat, Coldwater.

BRANCHIÆ. See GILLS.

BRANCHIOP'ODA (Gr. gill-footed), an order of *crustacea* (q.v.) of the division *entomostraca* (q.v.) deriving this name from the distinctive peculiarity of having the *branchiæ*, or gills, which are numerous, attached to the feet. They are all small creatures, many of them almost microscopic, and chiefly abound in stagnant fresh waters. Some are popularly known by the name of water-fleas (q.v.); the brine-shrimp (q.v.) is another example; and the genera *cyclops* and *cypris* may be mentioned, the former on account of its great frequency in stagnant fresh waters, the latter because its hard shells resist decomposition, and are therefore abundant in a fossil state.

BRANCO, RIO, a river of that portion of Brazil which, originally comprised within the understood limits of Guiana, lies to the n. of the Amazon. It rises in the Parime mountains, on the very borders of Venezuela; and after a southerly course of about 400

m., it joins, near lat. 1° 20′ s., and long. 62° w., the Rio Negro, of which it is the principal tributary, on its way to the Amazon.

BRANCURSINE. See ACANTHUS.

BRAND, a name given in some parts of Britain to some of those diseases of plants, especially of corn-plants, which are also called BLIGHT, BUNT, MILDEW, RUST, and SMUT.—See these heads.—It is the German name for the disease generally known in Britain as BUNT, and sometimes as *pepper-brand.* Both as a German and an English word, it appears to be derived from the verb *brennen,* to burn, and to refer to the burnt appearance which characterizes the diseases to which it is applied.—Its most common application in Britain, however, is not to any of the diseases already mentioned, but to a peculiar spotted and burnt appearance often seen on the leaves, and sometimes also on the bark of plants, which does not seem to be in any way connected with the presence of parasitic fungi, but which sometimes becomes so extensive as to cause the death of the plant. The nature of this disease is still somewhat obscure. Occurring most frequently when warm sunshine succeeds to moist weather or to hoar-frost, and frequently affecting plants in hot-beds upon which drops of condensed moisture fall from the frame, it has been ascribed to the concentration of the sun's rays by the drops of water on the leaf or bark—a theory utterly untenable, as no concentration can take place in such circumstances. The probability appears to be, that the action of the moisture unequally distributed, and particularly when sudden changes of temperature take place, deranges the vegetable functions, and destroys the fine tissues.—BRAND, a mark made on a cask for trade or excise purposes. See FISHERIES and TRADE-MARKS.

BRANDE, WILLIAM THOMAS, 1788–1866; an English chemist. He studied medicine, became a fellow of the royal society, and assistant to sir Humphrey Davy, succeeding him in the chair of chemistry in 1813. From 1816 to 1836 he and Faraday were joint editors of the *Quarterly Journal of Science and Art,* and in 1853 he received the honorary degree of D.C.L. of Oxford. B. was the author of several books on chemistry; but his fame rests chiefly upon his *Dictionary of Science, Literature, and Art,* a very useful work.

BRANDENBURG, a province of Prussia, in the center of the kingdom, in lat. 51° 30′ to 53° 45′ n., long. 11° 13′ to 16° 8′ e. B. has an area of 15,350 sq.m.; pop. '71, 2,863,229; '75, 3,132,483. It formed the nucleus of the Prussian monarchy, but the modern province does not quite correspond with the old *Mark* of B., which included also a part of the province of Saxony and of Pomerania, while it lacked certain small portions of territory now contained in the province of Brandenburg. Almost the whole province is a plain, so low that at Potsdam the surface of the river Havel is only 14.6 Prussian or about 15 English ft. above the level of the sea. The ground becomes slightly hilly towards Silesia. In general, the soil is sandy and naturally unfruitful. Without its numerous rivers and canals, B. would be one of the most barren tracts on the continent. The inhabitants are mostly Germans, mixed with French and Dutch colonists, who, however, are almost completely Germanized; and in the s. of the province, with people of Wend extraction. With the exception of 87,000 Roman Catholics, and 41,000 Jews they belong to the Protestant church. Agriculture and the rearing of cattle afford occupation for a considerable number of the inhabitants. The manufactures are silk, cotton, wool, linen, sugar, leather, paper, metals, etc. There are also numerous distilleries throughout the province. B. is divided into the governments of Potsdam and Frankfurt—Berlin, which is the capital forming a separate jurisdiction. In the beginning of the Christian era, B. was inhabited by the Suevi and afterwards by Slavonic tribes. It was subjugated by Charlemagne in 789, but it again acquired independence under his weak successors, and remained free until 928, when Henry I. possessed himself of it. After passing through numerous changes in connection with the general history of the German empire—of which we need here mention only the facts that Albert the bear (q.v.) became the first markgraf of B. in 1142, and Frederick of Nürnberg the first elector in 1417—it became associated with the rise of the Prussian state into a monarchy under Frederick I., elector of Brandenburg, in 1701. See PRUSSIA.

BRANDENBURG (the ancient *Brennaborch* or *Brennabor*), the t. from which the province Brandenburg is named, is situated on the line of the Berlin and Magdeburg railway, about 37 m. w.s.w. of Berlin. The river Havel divides it into two parts, Old and New B., which are both surrounded with walls. On an island in the river there is a third quarter, containing the castle, cathedral, equestrian college, etc. The cathedral has a fine old crypt, and several interesting antiquities. The inhabitants, amounting in 1875 to 27,371, inclusive of the garrison, are engaged in the manufacture of woolen, linen, hosiery, paper, leather, beer, etc. Boat-building is also carried on to a considerable extent.

BRANDENBURG, NEW, a walled t. in the grand duchy of Mecklenburg-Strelitz, n. Germany, is situated near the n. end of lake Tollen, about 50 m. w.n.w. of Stettin. It is a beautiful town, with regular, broad, and well-built streets. The grand duke has a palace in the market-place. It has manufactures of woolen, cotton, damasks, leather, paper, tobacco, etc., besides corn-mills, oil-works, and a trade in hides and horses, and is altogether a very thriving place. Pop. '75, 7495.

BRANDENBURG, CONFESSION OF, a confession of faith prepared by order of the elector of Brandenburg, with a view of reconciling the tenets of Luther with those of Calvin, and to terminate the disputes provoked by the Augsburg confession.

BRANDING was a mode of punishment practiced in England for various offenses. It was effected by the application of a hot iron, the end of which had the form which it was desired should be left imprinted on the skin. But B. by such means has long ceased, and now it is practically confined to the case of desertion from the army—the B. or marking being not done by a hot iron, but with ink, or other similar preparation. By the mutiny act of 1858, 21 Vict. c. 9, it is enacted by section 35 as follows: "On the first, and on every subsequent conviction for desertion, the court-martial, in addition to any other punishment, may order the offender to be marked on the left side, two inches below the arm-pit, with the letter D., such letter not to be less than an inch long, and to be marked upon the skin with some ink or gunpowder, or other preparation, so as to be visible and conspicuous, and not liable to be obliterated." Formerly, B. was employed in the case of all *clergiable* offenses by burning on the hand (see BENEFIT OF CLERGY); and with a view still further to repress theft and petty larceny, the 10 and 11 Will. III. c. 23, s. 6, provided that such offenders as had the benefit of clergy allowed them should be "*burnt in the most visible part of the left cheek, nearest the nose.*" This additional severity, however, not having the desired deterrent effect, but the reverse, was repealed by the 5 Anne c. 6, which nevertheless provided for offenders being burnt on the hand as formerly. The latter punishment, however, was entirely abolished by an act passed in 1822, the 3 Geo. IV. c. 38. Brawling in church (q.v.) was, by the 5 and 6 Edw. IV. c. 4, made an offense punishable by having one of the ears cut off, or, the offender having no ears, by B. with the letter F on the cheek. This punishment was repealed by the 9 Geo. IV. c. 31. B., therefore, in the case of felonies, has been entirely abolished.

BRANDIS, CHRISTIAN AUG., professor of philosophy in Bonn, was b. at Hildesheim, 13th Feb., 1790, his father being J. D. Brandis, one of the most distinguished physicians of his time. Having studied philology and philosophy at Kiel and Göttingen, he began lecturing in the university of Copenhagen, from which he removed to Berlin (1816). Here he was soon called upon to take part in the preparations for the great critical edition of the works of Aristotle, contemplated by the Berlin academy of science, 4 vols. (Berlin, 1831–36); and with this object, spent several years, along with Immanuel Bekker (q.v.), in exploring the chief libraries of Europe. In 1821, he resumed his academic career in the university of Bonn, where he edited Aristotle's *Metaphysics* (vol. i., Berl. 1823), *Scholia in Aristotelem* (Berl. 1836), and *Scholia Græca in A. Metaphysicam* (Berl. 1837). He accepted, in 1837, a call from the young king of Greece, and spent several years in that country as cabinet counselor. As a result, we have his *Mittheilungen über Griechenland*, Communications on Greece (3 vols., Leip. 1842). Other works of his are *Handbuch der Geschichte der Griech.-Röm. Philosophie* (3 vols., Berlin, 1835–66) and *Geschichte der Entwickelungen der Griech. Philosophie und ihre Nachwirkungen im röm. Reiche* (Berlin, 1862–64). He died July 24, 1867.

BRANDLING. See PAR and SALMON.

BRANDON, a village in Rutland co., Vt., on the Rutland division of the Central Vermont railroad, 16 m. n. of Rutland; pop. of township, '80, 3280. The place is noted for marble quarries. There are many manufactories; scales, iron castings, marble works, and mineral paints being among the most important. Near by are mines of iron, kaolin, and lignite.

BRANDON, a t. on both sides of the Little Ouse or Brandon river, where it separates Norfolk from Suffolk, 78 m. n.n.e. from London by road. Pop. '71, 2116. It has a considerable corn trade. Great rabbit-warrens occur near Brandon. There was formerly an extensive manufactory of gun-flints here, the army being exclusively supplied with these articles from B. before the introduction of percussion-caps.

BRANDT, SEBASTIAN, the author of a very popular German book, the *Narrenschiff*, or Ship of Fools, was b. at Strasburg, 1458; studied law and the classics with zeal at Basel, where he received permission to teach; and soon became one of the most influential lecturers in that city. The emperor Maximilian showed his regard for B. by appointing him an imperial councilor. He died at Strasburg in 1521. His Ship of Fools, a satire on the follies and vices of his times, which was published at Basel, 1494, is not very poetical, but is full of sound sense and good moral teaching, and was so much esteemed that the German popular preacher Geiler occasionally took his texts from it. It was translated into Latin by Locher (1497); and into English by Henry Watson, *The Grete Shyppe of Fooles of the Worlde* (1517); partly translated and partly imitated by Alexander Barclay, *The Shyp of Folys of the Worlde* (1508); and imitated by W. H. Ireland in the *Modern Ship of Fools* (1807). It has also appeared in French, and indeed in almost all European languages.

BRANDY (Ger. *branntwein*, Fr. *eau de vie*) is a term sometimes applied generically to all kinds of ardent spirits, but usually restricted to the liquid obtained by distilling the fermented juice of the grape. See DISTILLATION. The fermented liquors or wines which are employed for that purpose are various, and contain a proportion of alcohol (q.v.), which runs from 10 to 25 per cent of their weight. The red wines generally are pre-

ferred, as containing most alcohol; but though they yield a larger amount of B. than the white wines, yet the latter afford a spirit which possesses a finer flavor and more agreeable taste. 1000 gallons of wine give by distillation from 100 to 150 gallons of B., which varies in strength, but is commercially judged of according to the quantity of *eau de vie* or B. *à preuve de Holland* which it contains, and is generally diluted with water until it contains from 50 to 54 per cent by weight of absolute alcohol. When originally distilled, B. is clear and colorless, and if wished to remain so, is received and kept in glass vessels; but when placed in wooden casks, the spirit dissolves out the coloring matter of the wood, and acquires a light sherry tint, which is deepened by burnt sugar and other coloring matter, intentionally added by the dealers. The pleasant aroma of B. is due to the presence of more or less of fusel oil (q.v.) accompanied by œnanthic ether (q.v.). The most famous B. is that distilled in Cognac, a district in the w. of France, from the choicest wines, but comparatively little of that sold under the name of *Cognac* comes from this district. A second-class B. is obtained from the red wines of Portugal, Spain, etc., as also from the refuse (*marc*) of the grapes left in the wine-press, the scrapings of wine-casks and vats, the deposits in wine-bottles, etc.; and very much of the B. sold in Great Britain and Ireland is prepared at home from ordinary grain alcohol, by adding thereto argol (q.v.), bruised French plums, some French wine-vinegar, a little good Cognac, and re-distilling, when the spirit which passes over may be colored with burnt sugar, or by being kept in an empty sherry cask. Occasionally, grains of Paradise and other acrid matters are added, to give the B. a fictitious strength; and catechu or oak bark, to give it an astringent taste. B. is the form in which alcohol is administered medicinally either internally or externally. It is distinguished from other ardent spirits by its light, cordial, and stomachic properties, and especially when set fire to for a minute or two, forming what is known as *burnt B.*, it is valuable as a household remedy for diarrhœa. B. is administered internally (1), in *mild cases of diarrhœa*, unaccompanied by inflammation, but attended with griping pain, and the addition of nutmeg is productive of good; (2), as a *powerful excitant* for restoring patients who are suffering from suspended animation, and to relieve those who are laboring under fainting symptoms during an operation in surgery; (3), as a *stimulant and restorative*, where patients are much depressed in the ultimate stages of fever; and (4), as a *general stomachic stimulant* in indigestion after taking food, in the relief of flatulency and spasms in the stomach, and to check vomiting, especially in sea-sickness. Externally, B. is employed (1), in healing sores, and in stopping hemorrhage or the oozings of blood from bruised or injured parts, and is generally applied by soaking linen or cotton with it, and laying the cloth on the part; and (2), in hardening the skin or cuticle over tender parts, the soles of feet which have been blistered, and the nipples of females for several days before delivery. The action of B. externally appears to be strictly chemical, as it coagulates the albumen of blood, and otherwise tends to render more solid all flesh tissue.

The duty on B. imported into Great Britain, which from 1814 had been as high as 22*s.* 10*d.* a gallon, was reduced in 1846 to 15*s.*, and in 1860 to 8*s.* 2*d.*, but was soon afterwards raised to 10*s.* 5*d.* The consumption in the United Kingdom from 1822 to 1862, averaged about 1,400,000 gallons. From 1862 to 1872, it averaged 4,600,000 gallons. The import in 1875 was 4,087,441 gallons.

BRANDYWINE CREEK, a stream 36 m. in length, rising in Pennsylvania, and flowing through Delaware. In the latter state, it enters Christiana creek, about 2 m. above its confluence with the Delaware river, and immediately below Wilmington, a port of entry. It possesses a historical interest in connection with the war of independence—a battle, in which the British had the advantage, having been fought on its banks in Sept., 1777.

BRANEC'KI, or BRANICKI, FRANCISZEK XAWERY, d. 1819; a Polish statesman, who attended Poniatowski at St. Petersburg, and was privy to his amours with Catherine II. When Poniatowski came to the throne he rewarded B. with many honors, and he rose to be grand constable. B. was among the earliest to favor the partition of Poland, and was also active in the second dismemberment, for which, in 1794, he was declared to be a traitor. After the final partition he retired from public life and spent his days on the estates given to him by Catherine. In 1840, his descendants were made counts.

BRANFORD, a t. in New Haven co., Conn., on Long Island sound, and the New York and New London railroad, 8 m. e.s.e. of New Haven; pop. '80, 3,047. It is a place of summer resort, and has a good harbor for small craft.

BRANK, or BRANKS, an instrument formerly used for the punishment of scolds in England and Scotland, and often in the former country called "the scold's bridle." It seems to have come in place of the ducking-stool or cucking-stool (q.v.). "I look upon it," says Dr. Plot, in his *Natural History of Staffordshire*, published in 1686, "as much to be preferred to the cucking-stool, which not only endangers the health of the party, but also gives the tongue liberty betwixt every dip: to neither of which is this at all liable; it being such a bridle for the tongue as not only quite deprives them of speech, but brings shame to the transgression, and humility thereupon, before it is taken off." The B., in its simplest form, is a hoop of iron, opening by hinges at the sides, so as to inclose the head, and fastened by a staple with a padlock at the back; a plate within the front of the hoop projecting inwards, so as to fit into the mouth of the culprit, and by pressing upon the tongue, be an effectual gag. There must have been difficulty in keeping such

a hoop in its place; and so it received the addition of a curved band of iron, having a triangular opening for the nose, passing over the forehead, and so clasping the crown of the head that escape from it was scarcely possible. This may be regarded as the second form of the brank. In the third form, the curved band was hinged in the middle, and, passing over the whole head, was locked into the staple at the back of the hoop. The next addition seems to have been a second band crossing the first at right angles, so as to clasp the sides of the head, and keep the B. still more firmly in its place. In its last most complicated shape, the B., by the multiplication of its hoops and bands, took the form of a conical cage or lantern, with a door behind opening by a hinge and fastened by a staple, the front being fashioned into a rude mask, with holes for mouth, nose, and eyes. In one instance, the mask quite covers the face, the iron plate being hammered out to fit the nose, with apertures for the nostrils and the eyes, a long hollow conical peak, perforated with holes, being affixed before the mouth. The way in which the punishment of the B. was inflicted, may be described in the words of an eye-witness, reported by a country gentleman of Northumberland, Ralph Gardiner of Chriton, in a work, called *England's Grievance Discovered in Relation to the Coal Trade*, published in 1655, and dedicated to Cromwell: "John Willis of Ipswich, upon his oath, said that he was in Newcastle six months ago, and there he saw one Anne Bidlestone drove through the streets by an officer of the same corporation holding a rope in his hand, the other end fastened to an engine called the branks, which is like a crown, it being of iron, which was muzzled over the head and face, with a great gap or tongue of iron forced into her mouth, which forced the blood out; and that is the punishment which the magistrates do inflict upon chiding and scolding women, and that he hath often seen the like done to others." When the B. first came into use is unknown. It is found at Edinburgh in 1567, at Glasgow in 1574, at Stirling in 1600, and at Macclesfield, in Cheshire, in 1623. One B. in the church of Walton-on-Thames, in Surrey, has the date of 1633. In another, called "the witches' bridle of Forfar," dated in 1661, the gag for the mouth is not a flat plate, but a long piece of iron with three sharp spikes. Of two examples in private custody in England, one has the date of 1688, the other the crowned cipher of king William III. The B. was used at Langholm, in Dumfriesshire, in 1772; it was used still more recently at Manchester and at Macclesfield; and in the *Archæological Journal* for 1856, it is stated that "at Bolton-le-Moors, in Lancashire, the iron bridle was still in use, not many years since, for the correction of immorality: it was fixed in the female's mouth, and tied at the back of the head with ribands, and thus attired, the offender was paraded from the cross to the church steps, and back again." Examples of the B. may be seen in the Ashmolean museum at Oxford, in the National museum of the antiquaries of Scotland at Edinburgh, in the county hall at Forfar, in the Guildhall at Litchfield, in the town hall at Macclesfield, in the parish church of Walton in Surrey, and in St. Mary's church at St. Andrews in Fife.—Brank was at one time a common name in Scotland for any sort of bridle. The word is supposed to be derived from the Teutonic *pranghe*, a bridle. In the Dutch Netherlands, the pillory was called *pranghe*, from the yoke or collar in which the neck of the culprit is held. An instrument resembling the B. in its simplest form is said to have been in use among the Spaniards in the West Indies for the punishment of refractory slaves. See JOUGS.

BRANNAN, JOHN MILTON, b. 1819; a graduate of West Point; served in the Florida, Mexican, and the civil war; was made brevet maj.gen. in 1865.

BRANT, a co. in the province of Ontario, Canada, drained by Grand river and traversed by the Grand Trunk, Great Western, and Canada Southern railways; 420 sq. m.; pop. '71, 32,259. The principal productions are lumber, wool, hops, grain, butter, cheese, etc. Chief town, Brantford.

BRANT, JOSEPH (THAYENDANEGA), 1742–1807; a noted Indian chief of the Mohawks. He was a friend and secretary of gen. William Johnson in the Indian wars of 1755 and later, and took the English side in the revolution, having part in the massacre of Cherry valley and other bloody transactions. After the war he used his great influence to preserve peace. B. was strongly opposed to the sale of liquor to his red brethren. He had a tolerable education, and assisted in publishing a prayer-book and St. Mark's gospel in the Mohawk tongue. Col. Stone of New York wrote *The Life of Joseph Brant*, which was a popular book for half a century.

BRANTFORD, a t. in Ontario, Can., in Brant co., 75 m. n.w. of Buffalo, on the banks of Grand river, on the Goderich and Buffalo railroad; pop. '71, 8107. Manufacturing is the chief business.

BRÂNTOME, PIERRE DE BOURDEILLES, Seigneur de, was b. at Perigord, in Gascony, about 1527. He traveled in several countries in the capacity of chamberlain to Charles IX. and Henry III.; fought against the Huguenots (1562), in Barbary (1564), and went in 1566 to Malta, to fight against the Turks. After his return to the court of France he retired into private life, and wrote his *Mémoires*, full of self-praise but very interesting, as they afford a lively portraiture of the manners and morality of his times, the women, in particular, being very severely handled. The style is charmingly piquant, full of ingenious turns of expression, sudden sallies of wit, occasional flashes of eloquence, and withal so naïvely simple, that if the author cannot on account of the abundance of his gossip be reckoned a grave historian, he must needs be considered a most fascinating

chronicler. B. died July 15, 1614. His complete works were published at the Hague (10 vols., 1740), and were republished by Buchon in the *Panthéon Littéraire* (2 vols., Paris, 1837).

BRASDOR'S OPERATION. It is stated in the article ANEURISM, that a cure is effected in that disease by successive layers of the fibrine of the blood being deposited in the aneurismal sac, and that surgeons bring about this desired end by tying the artery at some point between the heart and the aneurism. In some situations it is impossible to do this, and therefore it was suggested by Brasdor that the course of the blood should be impeded *beyond* the aneurismal sac. This has not been tested to any great extent, but most surgeons think favorably of it; and the same principle can be carried out by pressure, without any cutting operation, as was shown by Mr. Edwards of Edinburgh, who succeeded in obliterating aneurisms at the root of the neck by pressure applied to the arteries beyond the tumor.

BRASENOSE, one of the colleges of Oxford university, sometimes called King's hall and college of B., was founded in the year 1509, by the joint benefaction of William Smith, bishop of Lincoln, at one time chancellor of the university, and sir Richard Sutton, knight of Prestbury, in Cheshire. The original foundation was for a principal and twelve fellows. Eight fellowships were afterwards added by various benefactors, from 1522 to 1586. This college is also very rich in scholarships and exhibitions; more particularly the Hulme exhibitions, 15 in number, of value £135 per annum each, besides £20 to be spent in books, to be approved of by the principal. The statutes of this college, which were issued in 1520, three years after the publication of Luther's theses, seem to have been framed by a person warmly attached to the Roman Catholic faith. They enjoin devotional exercises of a peculiarly popish character, such as repeating five times each day the Lord's prayer in honor of the five wounds of the crucifixion, of the angelic salutation in honor of the five joys of the blessed virgin, etc. These devotions were in some cases enforced by fines and whipping. The origin of the name of the college is obscure. Legends say that it was originally "brewing-house," which became corrupted into the present appellation; but Anthony Wood tells us that the college was "near finished out of the ruins of several hostels, the chief of which was Brasenose hall, so called, without doubt, from such a sign, which was in ancient time over its door, as other halls also had, viz., Hawk or Hieron hall, Elephant, Swan, or Bull hall." The former theory is supported by the fact, that B. has always been celebrated for the excellence of its beer; the latter is borne witness to by a nose in brass, curiously fashioned, which is now conspicuous over the great gateway. Till lately, all the fellowships were confined to natives of certain counties. The senior fellowships, owing to the appropriations of fines to the seniors, were very valuable, about £500 per annum; while the junior fellowships were about £80. By the commissioners appointed under 17 and 18 Vict. c. 81, many important alterations have been introduced. Five out of the twenty fellowships have been suppressed, one being elevated to the endowment of a professorship, the remaining four to the establishment of additional scholarships. All the remaining fellowships have been thrown open. The senior fellowships have been limited to £300 per annum; the junior raised to £150. Various oaths, previously taken by the fellows, committing them to statements which were untrue, and binding them to duties impossible to be performed, have been by the same authority abolished. B. presents to 24 benefices, besides 29 pieces of preferment vested in the trustees of the Hulme exhibitions, for behoof of the exhibitioners. Though considered what is commonly called a "good college," B. has never attained much distinction in the "schools." In all probability this has been owing to the restrictions subject to which its endowments were so long administered. The number of names on the books is about 500; the number of resident undergraduates is considerably over 100.

BRASH. See PYROSIS.

BRASH, SHIVERS, BLAZE, and RUBBLE, are names given in different districts to layers of broken and angular fragments of rock. They occasionally form the basement bed of alluvial deposits. At Canonmills, and other places near Edinburgh, the bowider-clay rests on a bed of shivers composed of fragments of the subjacent bituminous shale.

BRASHEAR CITY, a port of entry in Louisiana, on the Atchalafaya river, 80 m. from New Orleans, on the Morgan, Louisiana and Texas railroad. It has a good harbor, and a custom-house. The name has recently been changed to MORGAN CITY.

BRASIDAS, the bravest and most energetic Spartan general in the earlier years of the Peloponnesian war. Having distinguished himself (B.C. 431) by the courage with which he relieved the town of Methone from a hostile attack, he was made one of the chief-magistrates of Sparta. In 424, he relieved Megara; and in his expedition to Macedonia, in the same year, to aid the states which had thrown off their allegiance to Athens, he was completely successful. In 422, B., who could obtain no reinforcements from Sparta, had to encounter with his helots and mercenaries the flower of the Athenian army under Cleon. A battle took place at Amphipolis, in which both Cleon and B. were killed, but the army of the former was completely beaten. He was buried at Amphipolis, within the walls, and for long after his death his memory was honored as that of a hero, by the celebration of yearly sacrifices and games. The Greek writers speak highly of Brasidas.

Thucydides notices his eloquence, unusual in a Spartan, his justice, liberality, and wisdom, while Plato compares him to Achilles; but circumstances are not wanting to show that he was as much endowed with Spartan duplicity as with Spartan courage.

BRASS is an alloy of copper and zinc, largely used for household furnishings, certain parts of machinery, and other ornamental and useful articles. Technically, the term B. is extended so as to include compounds of copper and tin, as in *brass-ordnance*, the *brasses* or bearings of machinery, etc.; but such alloys of copper and tin, though styled *hard* B., are more strictly varieties of bronze (q.v.), and the present notice will be confined to the alloys of copper and zinc, or *yellow* brass. In ancient history, biblical and profane, frequent allusions are made to the employment of B. in the construction of musical instruments, vessels, implements, ornaments, and even gates; but as no mention is made of its mode of manufacture, or even of its composition, it is doubtful if the B. of the ancients was composed of copper and zinc. In the manufacture of B. on the large scale, two parts by weight of copper to one part of zinc are used, the zinc being one half the weight of the copper; but alloys are made for particular purposes with less or greater proportions of zinc. Thus, where a material of more than ordinary tenacity is required, the zinc is reduced to one fourth the weight of the copper; and where an alloy of a hard and brittle nature, possessing little resisting power, is wished for, the zinc is increased to an amount equal with the copper, or greater. In the manufacture of B., either of two processes may be followed. The direct method is to fuse the zinc in a crucible, and gradually add the copper in pieces. But this process is attended with disadvantage, owing to the volatile and oxidizable nature of zinc. The indirect method of forming B. is that which is generally followed in England and elsewhere, and consists in heating in crucibles or pots a mixture of calamine (carbonate of zinc, $ZnOCO_2$), charcoal, and thin pieces of scrap or grain copper. The calamine (q.v.) is generally first calcined or roasted, so as to expel any traces of sulphur, then mixed with one fourth of its weight of charcoal, and this mixture introduced into the crucible, after which the metallic copper is diffused through the mixture by being beaten in with hammers or mallets. The proportions employed are 3 parts of the mixture of calamine and charcoal to 2 parts of copper; and when introduced into a furnace, and subjected for 5 to 24 hours to the action of a white heat, the charcoal reduces the calamine and separates the zinc, which, combining with the copper, forms 3 parts of B., containing about 2 of copper to 1 of zinc.

For ordinary purposes, B. is first cast into plates of about 100 lbs. weight, and $\frac{1}{4}$ to $\frac{1}{2}$ in. thick, which can be readily broken up, remelted, and cast in a mold of any desirable shape or size. The crude casting so obtained is generally screwed to a turning-lathe, and turned and bored into the required form with iron tools. B. is very largely employed in the construction of door-handles, window-shutter knobs, etc.; and since the introduction of gas, though the brazen candlesticks have almost ceased to exist in towns, yet the immense number of stop-cocks and brass pendants and brackets required, has given a considerable impetus to the brass manufacture. The proportion of copper and zinc in the alloys resembling B., and which are known as *gilding metal*, *Mannheim gold*, *pinchbeck*, *bath metal*, *Bristol brass*, *Muntz sheathing metal*, *spelter*, *solder*, and *Mosaic gold*, have already been noticed under Alloy (q.v.).

BRASSARTS, the name of the pieces which, in plate-armor, protected the upper part of the arms, and united the shoulder and elbow pieces. Brachiale was the ancient name for brassarts. When the front of the arm only was shielded, the pieces were called demi-brassarts.

BRASSES (*sepulchral*), large plates of brass, or of the mixed metal called *latten* or *laton*, inlaid on slabs of stone, and usually forming part of the pavement of a church. The figure of the person intended to be commemorated was generally represented either by the form of the brass itself, or by lines engraven on it. Such, however, was not always the case, an ornamented or foliated cross, with other sacred emblems, being frequently substituted for the figure. Nor was the practice of imbedding them in the pavement uniform, as we sometimes find them elevated on what were called altar-tombs. It has been ascertained that the incised lines on these B. were originally filled up with some black resinous substance, and that in the case of armorial decorations, and the like, the field or background was often cut out by the chisel, and filled up with some species of coarse enamel, by which means the appropriate tinctures were produced. In England, the brass was usually of the form of the figure, the polished slab forming the ground, and the ornaments, arms, inscription, etc., were also inserted each as a separate piece. On the continent, where the metal was more abundant, the B. were one long unbroken surface, formed of plates soldered together, on which were engraved all the objects represented, the portions of the plate not so occupied being ornamented by elaborate flower-work. B. are known to have been used for monumental purposes from a very early period, though there are no existing traces of them in England previous to the middle of the 13th century. There is reason to think, that if not imported from France, they were at first executed by French artists. Latterly, the art took root in England, and English B., like English architecture, acquired a distinctive national character. The oldest complete specimen in England is that on the monument of sir John d'Aubernoun, at Stoke Dabernon. The knight died in 1277, and it is probable that the

brass was executed shortly after that date. Next in antiquity are those of sir Roger de Trumpington, who died in 1289, and sir Richard de Buslingthorpe, 1290; the former at Trumpington in Cambridgeshire, the latter at Buslingthorpe in Lincolnshire. In addition to the interest which they possess from their age, these B. are remarkable as being still unsurpassed in the beauty of the workmanship and the spirit of the design. As regards the earliest English B., it is further worthy of note that they are so similar, both in design and execution, as to lead to the conjecture that they are the work of one artist; whilst from their differing in many respects from the B. which were executed on the continent at the same period, it would seem that this artist, if not an Englishman, at all events worked exclusively in this country. In the following century (1325), on the brass of sir John de Creke, at Westley Waterless, in Cambridgeshire, the artist's mark is affixed by a stamp—a fact which has been regarded as a proof that his craft had attained to some importance, and that his services were pretty frequently called into requisition. But in this case, as in every other, with one exception, the name of the artist has perished. The exceptional case is that of the brass which once covered the tomb of bishop Philip, in the church of the Jacobins at Evreaux, in Normandy, where the inscription ended with the words, "Guillaume de Plalli me fecit." Many of the B. executed in England in the 14th c. are probably Flemish; and in the churches at Bruges some exist which appear to be by the same hand with others which are found in England. There can be little question, indeed, that for this, as for most of the other departments of the arts, which were afterwards successfully cultivated in England, we were indebted to continental artists. Nor will it surprise those who know the results of recent archæological investigations in similar subjects, to learn that the artists of France and Flanders in their turn were debtors to those of the worn-out empire of the east. As in painting, sculpture, and architecture itself, so in the art of working in brass, the sparks of antique genius which smoldered in Bysantium were the means of kindling those which afterwards burned so brightly in modern Europe. The taste for lingering

> Among the knightly brasses of the graves,
> And by the cold *hic jacets* of the dead,

has grown to something like a passion of late, and there are few subjects which have been more carefully illustrated than that of sepulchral brasses. References to most of the leading works, too numerous to be mentioned here, will be found in Parker's *Glossary of Architecture*, in an article in which their results have been carefully condensed. Of modern B., the most remarkable is that in the cathedral at Cologne, engraved in 1837, as a monument to the late archbishop.

BRASSEUR DE BOURBOURG, Charles Étienne, Abbé, b. Sept. 8, 1814; a French archæologist who studied theology at Ghent and was ordained at Rome in 1845. He was appointed vicar-general at Boston, Mass., in 1846. From 1848 to 1863, he spent nearly all his time in explorations in the s.w. United States, Mexico, and Central America, and in 1864 he was archæologist to the French expedition to Mexico. He is known for careful and philosophical study of indigenous American languages. In 1864, he announced that he had discovered in old archives at Madrid a key to inscriptions on the Central American monuments, and subsequently published a grammar and vocabulary of the Aztec tongue. One of his more important works is a *History of the Civilized Nations of Mexico and Central America during the ages prior to Christopher Columbus;* written from original documents entirely unedited, taken from the ancient archives of the aborigines, containing words of the heroic period in history of the Toltec empire." A bibliophilist of the day says of Brasseur de Bourbourg: "It is very difficult to assign the place which this extraordinary man will occupy in the annals of science, for his works are to-day nearly as great mysteries as the hieroglyphs his labors have illustrated. His industry in his researches into the history of the Aztec races is something not less than marvelous. When he had, with heroic sacrifice of all personal ease, accepted the life of self-immolation of a missionary to the Indians of Mexico; had studied for years the relics of Aztec picture-writing; had learned and systematized in great treatises their modern dialects; the immense works which he then printed upon the history of the pre-Cortesian races, made scarcely a ripple on the quiet of the scientific world. He stands alone in the vast temple of learning which he has restored, if he did not erect. No human being can contest his solution of Aztec pictographs, nor does there exist one who can prove it to be true. His numerous volumes have at least this merit—they have done much to perpetuate the memory of a wonderful race."

BRASSEY, Thomas, 1805–70; an English surveyor, widely known as a railway contractor of great capacity and enterprise. He was of an ancient family; received an ordinary education, and at the age of 16 became apprentice to a surveyor, to whose business he succeeded. His first railway contract was for a portion of the Grand Junction; then he completed the London and Southampton, with contracts involving $20,000,000, and 3000 workmen. In 1840, with a partner, he built the railway from Paris to Rouen, and a few years later was concerned in five other French lines, and as many in England, employing 75,000 men, and paying for labor alone from $75,000 to $100,000 every week. The capital involved in his contracts at this period was equal to $180,000,000. Having built railways in the countries named, and in Holland, Prussia, Spain, and Italy, he undertook the Grand Trunk of Canada, 1100 m. in length, with the great

bridge over the St. Lawrence at Montreal; and in subsequent years divisions of his army of laborers were found in almost every country in Europe, India, Australia, and South America. He was generous, modest, and simple in his tastes and manners. Though undecorated at nome, he received the cross of the legion of honor from France, the order of St. Maurice and St. Lazarus from Victor Emmanuel, and the iron cross (the first time it was given to a foreigner) from Austria.

BRASSICA, a genus of plants of the natural order *cruciferæ* (q.v.), distinguished by a round and tapering 2-valved pod (*silique*), of which the valves have each only one straight dorsal rib and no lateral veins, the seeds globose, in one row in each valve, and the cotyledons (q.v.) conduplicate (folded laterally). The species are chiefly natives of the temperate and colder regions of the old world; several are British plants. A number of species are very extensively cultivated, both in fields and gardens, and are of great importance in an economical point of view, particularly the cabbage (q.v.), of which kale, borecole, colewort, and different kinds of greens, Savoy, cauliflower, broccoli, Brussels sprouts, and kohl rabi are varieties; turnip (q.v.); rape (q.v.) (colza, cole-seed) and navew (q.v.). Among the British species is one, called Isle of Man cabbage, or wallflower cabbage (*B. monensis*), which differs from all these, and in some measure departs from the strict generic character, in having the valves of the pod 3-nerved, and one or two seeds in its beak. It has deeply pinnatifid leaves. It is found on the sandy shores of the w. of Scotland, the Isle of Man, the n. of Ireland, etc. Sheep and oxen are very fond of it, and it has been suggested that it might be profitably cultivated for feeding cattle. Its peculiar adaptation to sandy soils ought to recommend it to attention.

BRATTICE, the term applied to a partition of plate-iron or other suitable material which divides the main shaft of a mine lengthwise into two or more parts or gangways, to secure upward and downward ventilation.

BRATTLE, THOMAS, 1657–1713; b. Boston; a graduate of Harvard, who became one of the leading merchants of the eastern states. He published many papers on astronomical subjects, and in a private letter gave a good account of the witchcraft delusion.

BRATTLEBORO, a t. in Windham co., Vt., on the Connecticut river, and the Central Vermont railroad; 96 m. w. of Boston; pop. '70, 4933; in '80, 5882. It is connected with Hindsdale, N. H., by a bridge. It has an asylum for the insane, endowed with $10,000 by Mrs. Anna Marsh, a seminary for young ladies, and several large factories.

BRAUN, AUG. EMIL, an eminent archæologist, was b. 19th of April, 1809, at Gotha, in Germany. He studied at Göttingen and Munich, where he made the friendship of his teachers, Schelling and Gerhard; with the latter of these he went to Rome in 1833, and in a short time was made librarian, and subsequently secretary, to the archæological institute. He died at Rome, on the 12th Sept., 1856. B. wrote many valuable works on art in German, Italian, and even English. Among these may be mentioned *Il Giudizio di Paride* (Paris, 1838); *Kunstvorstellungen des geflügelten Dionysus* (Munich, 1839); *Griechische Mythologie* (Hamburg and Gotha, 1850); *Griechische Götterlehre* (Gotha, 1851–55); *Vorschule der Kunstmythologie* (Gotha, 1854, with 100 copper-plate engravings), translated into English by Mr. Grant; and an admirable guide-book, *Die Ruinen und Museen Roms* (Brunswick, 1854), translated into English, 1855. B. also executed numerous electrotype copies of ancient works of art.

BRAUNSBERG, a walled t. of e. Prussia, in the government of Königsberg, about 35 m. s.w. of the city of that name. It is situated on the Passarge; contains a Catholic seminary and gymnasium; and has manufactories of woolen and linen, and a considerable trade in yarn, grain, ship-timber, etc. Pop. '76, 10,796.

BRAUWER, or BROUWER, ADRIAN, a painter of the Flemish school, was b. at Oudenarde (or as others say, at Haarlem) in 1608. He was apprenticed to the well-known artist Franz Hals, who made profitable use of his pupil's great talents; keeping him in a garret like a prisoner, and making him work almost night and day, in painting small pictures, which Hals sold at very good prices. By the advice of a fellow-pupil, Adrian Van Ostade, young B. ran away from his hard taskmaster, and going to Amsterdam, found, to his own astonishment, himself famous as a painter. He now worked for himself, and might soon have made a fortune; but his intemperance was so extreme, that, it is said, he would never apply himself to painting while he could have credit or be supplied with liquor at a tavern. During the war in the Netherlands he went to Antwerp, where he was seized as a spy, and taken to the citadel. Here, to prove himself a painter, he executed a sketch of the guards who had him in their custody. This picture was shown to Rubens, who immediately exclaimed: "That is the work of Brauwer! No other artist could treat the subject in that style." B. was liberated through the interposition of Rubens, who gave him a lodging, supplied him with clothing and food, and in every way acted as a generous friend. But the sole return for all this kindness was, that B. secretly fled from the house of his patron, in order to renew his career of low dissipation. After visiting Paris, and failing to find work, he returned to Antwerp, where he died in the hospital (1640), and was interred, at the cost of Rubens, in the Carmelites' church. All B.'s paintings are marked by power and harmony of

coloring, and clearness of chiar-oscuro. They are pervaded by a jovial humor, and betray the favorite haunts and associations of the painter.

BRA'VI were those individuals in Italy, but especially in Venice, who undertook to perform any dangerous deeds for money. It is now employed chiefly to designate hired assassins. The Italians also gave the name of B. to those fanatics in the Turkish army, who, after maddening themselves by opium, rushed upon the ranks of the enemy, and so met death.

BRA'VO, "excellent!" "well done!" an Italian exclamation of praise, the superlative form of which is *bravissimo!* It is commonly used in England without distinction of number or gender; but the Italians say *bravo!* to a male singer or actor, *brava!* to a lady, and *bravi!* to a company of actors or singers.

BRAVO, NICOLAS, 1790–1854; a Mexican statesman and soldier who took part in the revolution of 1810 and others that followed. He was a firm supporter of Iturbide, the last emperor, and was a member of the regency of 1822; then deserted the emperor and was a member of the provisional government. In 1827, he led a revolt against Bustamente. In 1842, he held the chief executive power in the absence of Santa Anna, and was again president in 1846 until forcibly deposed. He fought for Mexico in the war with the United States in 1846, and after 1853 retired from public life.

BRA'VO DEL NOR'TE, or RI'O GRAN'DÉ, the largest river in the gulf of Mexico next to the Mississippi. It is politically important, as being throughout its whole course the boundary between Texas and Mexico; while physically its mouth may perhaps be regarded as that point on the coast where Central America, in its geographical aspect, begins to taper itself off towards the south. It rises in the Rocky mountains, near lat. 38° n., and long. 106° 30′ w.; and after a course of 1800 m. in a generally s.e. direction, it enters the sea near lat. 25° n., and long. 97° west. The commercial value of the river is not great, for, besides being for the most part very shallow, it is here and there beset by rapids and sand-bars. Smalls teamers, however, have got up as far as Kingsbury's rapids, about one fourth of the entire length of the stream.

BRAVO-MURILLO, JUAN, b. 1803; a Spanish statesman; at first a theological student; then a lawyer; the editor of the first law journal in Spain, also editor of two other journals. In 1837, he was a leading member of the Cortes, but was proscribed after the revolution of 1841, and took refuge in France. He was in the ministry in 1847, and on the resignation of Narvaez became prime minister. The revolution of 1854 caused him to fly again, but after 1856 he was recalled and given eminent positions.

BRAVU'RA, an Italian word, in music applied to a composition as well as style of performance. As a composition, the B. is an air or song, with many difficult passages and divisions of notes, requiring great spirit and volubility of execution. The intention of merely astonishing by execution has brought this species of composition into undeserved discredit. The B. style first came from the Neapolitan school. Rossini, Bellini, etc., united the B. with the cantabile style; and instead of leaving the embellishments to the taste of the singer, wrote the whole of the notes in the music. The compositions of Mozart, Beethoven, etc., give abundant proofs of how they united true artistic merit with the B. style

BRAWLING IN CHURCHES, in the law of England, is an offense against the public peace. This offense may generally be described as quarreling or creating a disturbance in a church; therefore, mere quarrelsome words, which are neither an affray nor an offense in any other place, are penal here. It was enacted by 5 and 6 Edw. VI. c. 4, s. 3, that if any person shall, by words only, quarrel, chide, or brawl in a church or churchyard, he might be prohibited from entering the church; and persons assaulting others there might be excommunicated, or have an ear cut off and be branded in the cheek. But that statute was repealed in 1860 as regards laymen, and justices of the peace, under the statute 23 and 24 Vict. c. 32, now deal with riotous, violent, and indecent behavior in churchyards or in churches and dissenting chapels, by fining the offender £5, or committing him to prison for two months. This enactment protects all kinds of religious services, though the jurisdiction of the ecclesiastical courts continues for some purposes. Constables and church-wardens may immediately apprehend and remove the offender. Other regulations respecting the disturbance of a congregation, or molestation of a clergyman during divine service, will be found in the 1 Mary, c. 3 (1553), which, although of Roman Catholic origin and application, is still held to be the law for the protection of the Protestant established church. It enacts (section 2) that if any person or persons shall willingly and of purpose, by overt word or deed, molest or disquiet any preacher . . . . in any sermon, preaching, or collation, that he shall make in any church, chapel, *churchyard*, or in *any other* place or places, used or appointed to be preached in; or (section 3) if any person or persons shall molest a priest preparing or celebrating mass, "or *other such* divine service, sacraments, or sacramentals as was most commonly frequented and used in the last year of the reign of the late sovereign lord, king Henry VIII., or that *at any time hereafter* shall be allowed, set forth, or authorized by the queen's majesty;" or shall abuse the blessed sacrament—such person or persons shall be liable to be committed to gaol, there to remain without bail or mainprize for the space of three months then next ensuing; and further, to the next quarter-sessions,

at which the persons so offending shall only be delivered and discharged out of prison upon sufficient sureties for their good behavior during one whole year. The act contains other regulations for the protection of the ministrations of the church, and it saves the jurisdiction of the ecclesiastical law.

By another act, 1 Will. and Mary, c. 18, s. 18, passed in 1688, it is provided that if any person or persons shall disquiet or disturb any cathedral or parish church, chapel, or other congregation, or misuse any preacher or teacher, such person or persons may be committed to prison, and, on her conviction, be fined £20.

It remains to be added, that reviling church ordinances subjects to fine and imprisonment—and profaning the Christian religion, and depraving the Book of Common Prayer, are also subjects of penal legislation. See on this subject 1 Eliz. c. 2, and the 14 Chas. II. c. 4. See also BLASPHEMY and RELIGION, OFFENSES AGAINST, in which latter the Scotch law on the subject of this article will be found stated.

BRAWN, a preparation of meat made from the head and belly-piece of a young pig, with the addition of ox-feet, to render it gelatinous. The whole is rolled up tight in sheet-tin, and boiled for four or five hours. The moisture is then well pressed out of it, and having been allowed to stand for some ten or twelve hours, the meat is put into cold salt and water, and is then fit for use. B. seems to have been a well-known dish as early at least as the latter part of the 15th c., for in Tyndale's version of the Book of Common Prayer, revised by Cranmer, and still in use, in the 70th verse of the 119th psalm, we find the words: "Their heart is as fat as *brawn*." The B. of Wiltshire is celebrated, and it is also a famous dish in Canterbury.

BRAXTON, a co. in West Virginia, 646 sq.m.; pop. '70, 6480; in 80, 9730. It is a hilly and wooded region, but well watered, and generally fertile. Co. seat, Sutton.

BRAXTON, CARTER, 1736–97; b. Virginia; one of the signers of the declaration of independence. He succeeded Peyton Randolph as a delegate in the Continental congress, and served in the state legislature.

BRAXY, BRAXES, BRAXIT, BRACKS. These words are given as synonymous in Jamieson's *Dictionary*, indicating a disease in sheep. In the dialect of Angus, it is called braik and bracks. The derivation of the word is uncertain. The vague way in which the term braxy is used, renders it difficult to define the disease, for in different parts of the country, totally different disorders are included under this head. Of the two most generally recognized as braxy, the one is an intestinal affection attended with obstinate diarrhea; the other is a blood disease, and the result of plethora or fullness of blood. The second, which is spoken of by the better informed shepherds as the true braxy, may best be described here.

Causes.—A very lean flock of sheep placed on rich food is very apt to be decimated by braxy. By rich food is meant more particularly those substances containing an abundance of nitrogenous principles, such as luxuriant heather, strong and succulent grass, the best turnips, etc. Hilly land is favorable to the production of braxy, from the firm nature and nutrient qualities of food growing on it. We find the disease in such situations in the winter season. About the month of November, many of the well-fed hogs placed on turnips die suddenly from braxy; and, again, when farmers resort to the forcing-system towards spring, the mortality is great, particularly when, in addition to much artificial food, sheep are allowed rich pasture. The mortality is greatest at the period of full moon, from the sheep grazing during the light nights as well as by day. The shepherd very frequently at these times finds one or two dead in the morning. Some assert that, in the winter, exposure induces braxy; and it is very possible that it may be produced by any sudden check to the exhalations, which tend so much to maintain the balance of the functions and purify the blood.

Symptoms.—The animal, in full health, suddenly ceases to eat, has a staring look, is peculiarly excitable, and separates itself from the flock. The head is lifted high, the breathing becomes labored, the countenance appears anxious, and the animal loses the power of its limbs. It totters, falls over, is seized with convulsions, and dies within five or six hours, and often within an hour from the first symptoms of the disease.

Cadaveric appearances.—If the sheep's throat is cut before it dies, the absence of any peculiar appearances within the body is very remarkable: the flesh appears of a dark-red color, and the veins are charged with dark blood, but, on the whole, the body of the sheep looks so well that the mountain-shepherd cuts it up to make "braxy mutton." If the sheep is allowed to die of itself, the body soon swells, putrefies, and is rendered useless.

Treatment.—The prevention of the disease alone affords hope, and it consists in regulating the animal's diet, to prevent sudden transitions from low to rich keep; to mix food so as to modify the action of the more highly nitrogenized kinds; and to check the development of plethora or fullness of blood by saline purgatives and diuretics, such as Epsom and Glauber salts or niter. The principles to be followed out in preventing this disease are precisely similar to those referred to under the head BLACK QUARTER in cattle. Shelter during severe winter weather is insisted on by shepherds as essential to prevent the malady.

Braxy mutton, above alluded to, is, as a general rule, not unwholesome; though in warm climates the same disease in sheep assumes a very malignant type, and indeed

constitutes one of the carbuncular diseases. Though the flesh can be eaten with impunity in the mountains of Scotland, it is most dangerous and condemned in southern Europe.

BRAY, a maritime t., situated partly in the co. of Dublin, partly in that of Wicklow, 13 m. s.e. from Dublin, with which city it is connected by the Dublin, Kingstown, and Bray railway, and the Dublin, Wicklow, and Wexford railway. The pop. in 1861 was 4182, and in 1871 had risen to 6087, of whom 4562 were Roman Catholics, 1315 Protestant Episcopalians, and the rest of other denominations. Some years since, B. was a small fishing-village; but the beauty of its situation has made it a popular watering-place, as well as a favorite position for villa residences; and under the enterprise of a few active speculators, it has not only grown in its dimensions, but the extensions have been carried out with excellent taste and spirit. The most striking buildings are the new hotels, and a Turkish bath, recently diverted to other purposes. The affairs of the municipality are administered by town commissioners. B. has a weekly newspaper.

BRAY, a parish in Berkshire, England, 25 m. w. of London. In this curacy a vicar in the 16th c. was a Roman Catholic with Henry VIII., a Protestant when the king changed his mind, again a Roman Catholic under Mary, and again a Protestant under Elizabeth; avowing his only religion to be to "live and die vicar of Bray."

BRAY, Mrs. Anna Eliza, an authoress, is daughter of the late John Kempe, Esq., of the New Kent Road, Surrey, and was b. towards the end of last century. At an early age she showed much of the imaginative faculty, and a taste for design, which latter brought her the acquaintance of the celebrated Mr. Stothard, R.A. From Stothard she took lessons in drawing; and in Feb., 1818, married his second son, Charles Alfred Stothard, also an artist, and author of a well-known work entitled *The Monumental Effigies of Great Britain, selected from our Cathedrals and Churches*, etc. In July, 1818, she accompanied her husband to France. Their tour and residence in France lasted until about the middle of Nov. in the same year; and Mrs. Stothard wrote an agreeable and lively account of her first foreign experiences, under the title of *Letters written during a Tour through Normandy, Brittany, and other parts of France, in* 1818, *with Numerous Engravings after Drawings by C. Stothard, F.S.A.* (Lond. 1820, 4to). Subsequently, Mrs. Stothard accompanied her husband on a similar tour in the Netherlands. In May, 1821, however, she had the severe misfortune to lose her husband, who was killed by falling from a ladder. In 1823, Mrs. Stothard wrote a life of her husband, entitled *Memoirs, including Journals, Letters, Papers, and Antiquarian Tracts of the late C. A. Stothard, with Connective Notices of his Life, and some Account of a Journey in the Netherlands.* Distress of mind brought on ill health, and Mrs. Stothard suffered from an affection of the eyes, which obliged her to give up literary labor altogether for more than two years. In 1825, she married the Rev. E. A. Bray, vicar of Tavistock; and in the following year published a historical romance entitled *De Foix*, which she had begun during her first husband's lifetime. The idea of this romance was conceived during the tour in Normandy; and similarly, that of her second romance, *The White Hoods*, during her tour in the Low Countries. This was published in 1828, and was followed by *The Protestant*, also in 1828; *Fitz of Fitz-Ford, a Legend of Devon* (1830); *The Talba, or Moor of Portugal* (1830); *Warleigh, or the Fatal Oak, a Legend of Devon* (1834); *Trelawny of Trelawne, or the Prophecy, a Legend of Cornwall* (1837); *Trials of the Heart* (1839); *Henry De Pomeroy* (1842); and *Courtenay of Walreddon, a Romance of the West* (1844). A collective edition of all these romances was published in ten volumes in 1845, with a "general preface," in which the writer mentions the circumstances under which each was produced. Mrs. B. is also author of *The Borders of the Tamar and the Tary* (1836); *The Mountains and Lakes of Switzerland* (1841); *Trials of Domestic Life* (3 vols., 1848); *Life of Thomas Stothard, R.A.* (1851); *A Peep at the Pixies* (1854), and *Händel, his Life, Personal and Professional, with Thoughts on Sacred Music* (1857). In July, 1857, Mrs. B.'s husband died; and in 1859, she published his *Poetical Remains.* In 1870 appeared *The Good St. Louis and his Times*, and *The Revolt of the Protestants of the Cevennes.* In 1871 came *Hartland Forest, a Legend of North Devon;* in 1873, *Joan of Arc, and the Times of Charles VII., King of France;* and in 1874, *Roseteague.*

BRAY, Sir Reginald, d. 1503; an English architect, a favorite of Henry VII. He built the chapel of that king in Westminster abbey, and decorated St. George's chapel at Windsor.

BRAY, Thomas, D.D., 1656–1730; educated at Oxford, and rector of Sheldon. He was sent to America to regulate the affairs of the church just established in the colony of Maryland, and afterwards took much interest in foreign missions, in aid of which he published *Bibliotheca Parochialis*, and a discourse on *Apostolical Charity.* He was also the author of *Catechetical Lectures; Martyrology, or Papal Usurpation*; *Directorium Missionarium*, and some other works.

BRAYERA. See Cusso.
